You can't argue with people that don't know how to argue. But you can bicker 24 hours a day, seven days a week with anyone.......seems to me this series of messages is for people who LOVE to annoy each other, therefore I shall never visit this thread again. What an oppurtunity to take your best shots at somenone! Bye!

So? What will actually run on this setup, or is contemporary software availablity
much like the Falcon or ST?

[deletia]

So? What are the schools unable to do?

In most cases, those 'technology drivers' are peripheral at best.

: Where is everyone? I leave for awhile and this area is dead..

We're still here. We're just having a rest while we think up more reasons
to knock you Mac and PC owners off your 'pedestal'... :-)

: By the way, you can pick up 8/16 bit color LC's with HD for under $200. So
: LC's with internet capabilities render the ST a bad investment..

My father purchased a 2nd hand LC III a short while ago for New Zealand
$1800 which is around US$1200 (8meg RAM, 240meg HD, 14" screen, CD-300
CD-ROM). He said he purchased it because the screen looked similar to my
Falcon desktop. So far it has failed to talk to the CD-ROM, crashed
occasionally, and been a general pain in setting up any software he tries
to install on it. On top of that, MacOs 7.1 (I think it is 7.1 for this
model?) seems slower than the TOS 1.2 STfm sitting next to it!! Just
imagine how much slower the Mac desktop will be than than my Falcon desk!!!

Just to show I care...

If the school system has -unlimited- funds, fine...let them buy the top of
the line in everything...Education decidedly deserves the best...However,
if they are operating along "real world" constraints, then I would, beyond

a shadow of a doubt, recommend the (used) ST line as a viable, economical, alternative...

Dropping one of those (Pentium 166) from a great height onto the head of the person who created the "can't save desktop in Medium rez" bug in TOS 1.06 would be the way to go.

"TOO ULTIMATE".

Come to think of it, just dropping the Pentiums from a great height for no good reason would be even better!

It appears that an investment in Atari on Jan 1 of this year
would have been a better investment than IBM or Netscape or HP or
Yahoo or Microsoft or Adobe or any of those companies that are
always in the news. I never hear anything about Atari.
Do they actually have any products? Well, something seems to be
going on as the stock has tripled in price over the last few months?

Is there something we should know?

I guess New Zealand is behind the times on hardware and price compared to the
U.S.... Did he set up the Cd-Rom correctly on the SCSI chain?  I don't know why
it doesn't work.  Maybe the CD drive or the cable is defective..  A local Apple
reseller may help..

Okay, since you are a slow learner, I am referring to the LCII.  The LC and
LCII had the same performance and not whole different accept the processor.

     Please explain how the LC would be more "relative"...Overall operating
     costs, IMHO would be higher...

I dropped into this site to see if anyone was discussing this
phenomenon.  I thought about Atari Stock several times when it was low.
Alas.

So? How do these differ from the limitations that would be imposed by a
$200 386 system? What graphical browser(s) will run on it? How does this
benefit the school beyond the AppleII's that are likely already in place?

What do the students get out of all this besides not having to use a
typewriter?

This is only rhetoric.
How does knowledge of ClarisWorks and Z-Term enhance your preparedness
for the 'real world'? Why could not the same be had with older (presumably
existent) 'Turing Machine' computers?

The entire curriculum need not be entwined with the computer room for
students (at any level) to be sufficiently introduced to them. Going out of
one's way to apply a tool does not necessarily enhance it's effectiveness.

>>
>>   In most cases, those 'technology drivers' are peripheral at best.
>
>?

The 'gadgets' could be ripped away without affecting the curriculum
or quality thereof.

In many instances it is the teachers that need the most upgrading
(not the computers). That is where the most potential gain wrt
to 'investment' is.

If one is not servicing a specific need, 'new' computers are just a
waste of money. It is one of those 'feel good' 'do-nothing' type 'solutions'
where one just throws money at a problem without any real mental
engagement or time expecting the problem or (the resposibility for that
problem) to suddenly evaporate.

You make a poor argument, especially considering that there are MUCH
better ones to be made (and have).

The wealth of the software base is relative, plus you can instal an Apple II card to run many of the useful apps.

In what way would the overal operating costs be higher? The LC does not need premium electricity to run-->.

I am not concerned with the 386 issue, it's irelavant! The relevant issue is
the use of the ST. The majority of the installed base of LC's in use is at the
k-12 level. The LC can use NCSA telnet, microphone and much of the browser
apps. However, won't be a speed demon. With inexpensive Apple II card
installed in the LC can run useful Apple II software.

There will always be a cost involved in aquiring ST software such as near zero
k-12 apps. With cheap LC's, a computer lab and media center can be stocked
with inexpensive hardware along with the wealth of apps..

Higher order learning skills through interaction from the new apps being
available.

I don't consider aquiring computer technology as the gadget thing.. Planning
for instituting the gadget in to the curriculum is important. And is a reason
why computer technology in many schools is a waste.

> In many instances it is the teachers that need the most upgrading
> (not the computers). That is where the most potential gain wrt

Of, course, teachers have to come aboard 100 percent. Just because of your
expereince of seeing computers not being utilized as it should does not mean is
the norm nation wide.
>

Maybe from your little observations, but in the districts I have been to, it's
the oposite. Generalizations will not get anywhere and ends of condemming all.

>
> You make a poor argument, especially considering that there are MUCH

I don't think so..I have credibility and you don't..

               So. Name a few essentials, or at least standards.
               Also, how does the machine's age effect it's viability for new
titles?
               Is it stuck in time (much the same way a 386 or appleII would be).

               Also, software usually isn't free unless it's pirated... (even if
it is apple)

I suspect you are rather selective about what you deal with, much like catholic
school nuns. The swill is out there and not hard to miss at all. Just bother to look.
Much of the country still needs to learn to crawl and you think they'll manage
to run... (assuming any new hardware is put to effective use anyways)

>
>>
>> You make a poor argument, especially considering that there are MUCH

PETER SINCLAIR-DAY <sinclap2954@cobra.uni.edu> writes:

>The wealth of the software base is relative, plus you can instal an Apple II

Precisely. . . "wealth" is relative.
---
Why not try matching needs to costs, and select the lowest cost option?
If we're looking at the purchase of used computers in a school that has
none available, a used PC clone would be cheapest and most readily
available. It would also have the greatest "relative wealth" of software.
If the machines are already in the classroom, you should use what you've
got if its economically viable.
---
The argument for the LC over a free ST is like saying that an 82 AMC
Spirit is available for $200, why even go for the $100 79 LeSabre?

PETER SINCLAIR-DAY <sinclap2954@cobra.uni.edu> writes:

>I am not concerned with the 386 issue, it's irelavant! The relevant issue is

Irrelevant. . . because your case crumbles when viewed from that angle.

>k-12 level. The LC can use NCSA telnet, microphone and much of the browser
>apps. However, won't be a speed demon. With inexpensive Apple II card
>installed in the LC can run useful Apple II software.

And a 1040ST can run PC, Atari 8-bit, and CP/M for free with public domain
utilities. Your point?

>There will always be a cost involved in aquiring ST software such as near zero
>k-12 apps. With cheap LC's, a computer lab and media center can be stocked

What, pray tell, _are_ "k-12 apps"? Educational games, like Bentley Bear
or kidPRGS? Or is this another rhetorical gesture?

>Higher order learning skills through interaction from the new apps being
>available.

Oh, boy, you've pulled out the old "higher level thinking skills" pot.
Higher level thinking skills, besides being a piece of rhetoric used to
justify institutional opression of many of our children, is the ability to
think and reason, and solve problems. Computer brands have _NO_ effect
on this skill. These skills are aquired through the solving of problems,
and involve resourcefulness and freedom, rather than mandatory, mandated
"tools" like Mac LC's.

>I don't consider aquiring computer technology as the gadget thing.. Planning

Why not? Show that the utility gained exceeds the net cost, and that similar
utility wouldn't be available via the cheapest option. If you cannot,
(as is the case), then the word "investment" to describe the purchase is
a misnomer.

>Of, course, teachers have to come aboard 100 percent. Just because of your
>expereince of seeing computers not being utilized as it should does not mean is
>the norm nation wide.

Reread that and tell me what's wrong with this picture
. . . (substitute the word "computers" with "Atari STs"). . .

I am not selective at all. I recal back in the old days when the Atari 8 bits,
C-64 and the Apple II were the norm. The gagets were a must have but were not
being utilized for the intended purpose. And that is true today.

I see running away from the ST and bringing in the 386. The 386 is a generic
term. Not all 386's have the same features and configurations. For me to
comment on a 386 issue is not relavent..

Sure, the software base is relative...thats why the ST is viable! Install more hardware? Hmm...

The ST line is the -cheapest- to operate and maintain, period. I don't remember saying anything about what kind of electricity it needs to run. Of course, maybe "premium" electricity would add a little zip to that old Macs performance...<grin>

Lesse... more software... easier to get... sometimes cheaper...
Since your whole little point was that your could get a complete and better
supported machine for less [than an ST], used 386's are as much relevant to
your point as any '030 machine.

Although, it was primarily brought up for the 'orphaned by age' point but
that got
lost on you...

>term. Not all 386's have the same features and configurations. For me to

Complete 386's (16Mhz,4m/80M) can also be had for under $200 dollars. One
also needn't search as hard to find them.

>comment on a 386 issue is not relavent..

>386 unless your are conceding.

      It's not off topic at all. The LC may be as much of an orphan as a 386. It's
      bus is passe, it is passe. No more software is being written for it. That
which
      may trickle down is being written for PowerPC's & 040's if you're lucky.
      It is orphaned by age as everyone else has moved on. Whereas what little
      that comes out for the Atari will very likely run on an ST.

      Both 030 & 386 are stuck in the past. They are to even a slightly more
degree
      than ST's.

      Although, a 386 at least has bargain bins going for it these days...

>>>the use of the ST. The majority of the installed base of LC's in use is at the

Well, if you can't even give me one good concrete non-rhetorical reason
for getting new machines, then I should not take your claims seriously.

You simply have not attempted (much less actually managed) to prove a point.

In what way is it the cheapest to operate? No electricity needed? Where does
one acquire this wealth of apps?

Getting off the issue of the ST, I see. So the ST can't hold its own and you
concede by drawing in the 386. Do all 386's come with 256 color graphic
boards?

Sounds like sour grapes to me. Educational Resources is the premiere catalog
for the K-12 market. You know, the bible. I have not seen one ST title
listed.

The LC will serve as a secondary tool.  Netscape runs on the LC, except for a
speed hit.  Many of the LC's contain 040's as well. You're last sentence does not
make sense.  There are more titles for the LC than there will ever be for the
ST.. What is that little that comes out for the ST?  State the titles?

One of the reasons that Atari Stock has increased so much since Jan is that a few months back (March I think) they invested 25-50 million dollars in a merger with a Disk Drive company (JTS?) Atari chairman Jack Tramiel is now on the Board of the new merged company and for now the two companies will operate under the (JTS?) name. Technically as an individual entitiy Atari no longer exists, but the new merged company can produce products using the Atari name and logo....

Hope this helps....

The reason that the stock went up is when Atari announced that they are getting out of the video console market.

Read their 10K report to SEC.

>one acquire this wealth of apps?

It is the cheapest to operate because:

1) Software is available at bargain-basement prices (many times free) especially when held up to comparable software on alternative systems.
2) Atari hardware is notoriously reliable...
3) You don't have to spend $$$ everytime a new standard is enacted just to upgrade...(especially in the PC world)

Please read my postings again, but carefully...at no time did I say that Atari machines did not need electricity... :)

Why, Mr. Sinclair, you are accessing the very medium that allows Atari owners (as well as other platforms owners) to acquire nearly unlimited apps...I'm referring to the Internet, of course! :)

>
>Your point?
>> ---
```

Exactly. You had no point. So the Mac LC can run obsolete Apple II software.
The 1040ST can run obsolete PC, 8-bit and CP/M software. If you're using
this as a point to say that the Mac is somehow "better supported," you're
simply incorrect.

>> What, pray tell, _are_ "k-12 apps"? Educational games, like Bentley Bear
>> or kidPRGS? Or is this another rhetorical gesture?
>
>I thought you knew? Pick up a catalog Einstein..

Again, what is a "K-12 app"? You've not defined this. Until you do, you're
statement is meaningless. It's like me saying that the Mac has no "Mega Super
Cool" apps. Just what is a "Mega Super Cool" app?

>> on this skill. These skills are aquired through the solving of problems,
>> and involve resourcefulness and freedom, rather than mandatory, mandated

>the city issue $300 million in bonds to finance a football stadium to bribe for
>the prestige.

I suffered greatly through primary school since I attempted to think and
reason in ways that contradicted the teachers' point of view. The fact of
the matter is, no expenditure of money for computer equipment generates or
furthers "higher level thinking skills." Computer equipment's main utility
is as a supplement - one that helps students learn. You have yet to show how
an expenditure of tens of thousands of dollars and hundreds of hours of time
justifies this.

As for "knowing it all," I have been through the school system. I'll soon
have kids who will be going into it. If the justification for spending massive
sums of money on equipment is that it "stimulates higher thinking skills,"
I'll chuckle. Try coming out into the real world, with fifty-hour work
weeks, and see how far this reasoning will take you.

As for my political views, again, you're way off base. I would not vote to
have "taxpayer money" spent on any frivolous venture. I'll tell you what.
Why not let me keep my educational taxes and educate my kids in the manner
that I see fit, and you send yours to public schools that spend massive sums
of money on things likeyou described. Then, let's send them out into the
real world. I'm pretty darn sure my kids will have the edge.

>> Why not? Show that the utility gained exceeds the net cost, and that similar
>> utility wouldn't be available via the cheapest option. If you cannot,

>> a misnomer.
>> ---
>

>Oh, please YOU have no credentials or know what is needed..

What are your "credentials"? I have worked in the computer consulting, accounting, and computerized automation business for years. When someone says "investment," they mean an expenditure that will return more than their initial cost (and more than an expenditure elsewhere would return). You have yet to prove that.

Besides, the "credentials" you seem to be throwing around is education in a podunk state university. Again, spend some time in the real world.

>> Reread that and tell me what's wrong with this picture
>> . . . (substitute the word "computers" with "Atari STs"). .
>
>
>Yea right..Its cheapscapes like you that schools suck in may areas.
>Schools can't be run like business..

I have no problem spending as much money as is needed on my kids' education. In fact, I will probably spend more on them than you shall. Where I object is in spending that has _NO PROVEN INTRINSIC VALUE_. If opposing spending of tens of thousands of dollars on something that has no proven additional benefit that can match the expenditure makes me a "cheapskate," so be it. It's easy to be a free spender with other peoples' money. But run up that balance on a credit card for "investments in yourself" like hairstyles, expensive clothes, and other things you cannot afford, and you'll get no sympathy from anyone. The only difference is in the amount of money and whose money it is. . . the logic is exactly the same.

>>
>> Is there something we should know?

The reason is simple. Atari recently merged with Jugi Tandon Systems, a new maker of hard drives resurrected from Kalok Corp. The stock isn't "Atari" stock anymore, it is now JTS stock. The shares now reflect the value of Atari Corp. (snickers kept quiet) and JTS. Thus the entity now reflected by the ticker symbol ATC is far bigger, far different, and has a far better future than the Atari Corp. of a few months ago.

I predict that the Atari name will soon be irrelevant. Tramiels are out of the management game, for the most part, Jag stock is being liquidated, and JTS is looking to sell the name and rights to the technology. Any "Atari" that exists in the future will be a new company with the old technology and perhaps patents.

What is this bargain basement apps?  How much?  The Corel Corporation has a
whole suite of education apps at $19.95

>      2) Atari hardware is notoriously reliable...

You're opinion.  I can say that the LC notoriously reliable.

>      3) You don't have to spend $$$ everytime a new standard is enacted just

What could that be?  Can the lowly ST use Netscape just like the lowly LC?

Again, what the heck is a "K-12 app"? Usually, it's fancy video games that purport to teach students. Some do, some don't. Most aren't very useful except as a substitute for teaching (and a waste of money).

Again, a K-12 "app" isn't an app, but a video game that doesn't rot the brain quite as badly as the rest of them, but is a video game nonetheless. Mr. Sinclair wants to pay for Macintoshes using a credit card billed to us so kids can play video games in school. Unbelievable. Play games at home. Learn about real world applications, like programming, office productivity, communications, and the arts on computers. All these areas are served adaquately by the TOS machine. There are even more than a few education video games for the machines as well - many of them cheap or free.

Call CeeJays Software, or the Computer Dungeon and order their catalogs, in said catalogs you will find first-class hardware, software, etc, at simply incredible prices...Their listings are way too large to post in this newsgroup....

>You're opinion. I can say that the LC notoriously reliable.

Its not just "my" opionion...Atari hardware is recognized the world over by computer users with far more experience than myself as being very, very reliable...my first Atari 520 ST that I bought in 1986 is still being used by my best friend to this day--total repairs in all that time? One $59.00 power supply...

>Why would I have to if the existing ones work well. Ever hear of progress. I
>guess the ST platform is safe since innovation and development have all but
>stop.

New TOS clones with amazing power and features are being released -still- but of course you've probably never heard of Computer DirecT... Innovative software is also still being released (especially from the Euro-crowd)

>He he he. Still generalizing.

No sir-I was just answering your charge that Atari computers did not need electricity...that was what you implied that I said, although I did not say any such thing in any message...

>What could that be? Can the lowly ST use Netscape just like the lowly LC?

Actually, no...but with innovative programs like Oasis and CAB who needs a bloated piece of software that looks like it mated with a porcupine with all the holes in its security! %^)

Since the comparison seems to make you uncomfortable I'll just have to
conclude that a 030 Mac has limitations similar to 386's. Since those were
already dispatched, your LC goes down as well.

        The public shouldn't need to. The more adept should be able to communicate
        effectively. If they cannot manage 'superior feats', then their 'superior
aptitudes'
        are meaningless. Language is a communications tool. It should be used as
such.

Sounds like sour grapes.  There is nothing on the ST side that can mact
Netscape.

ROTFL... The Cedar Falls School District is excellent due to the investment and
backing by the parents.  Many of the parents are faculty here at UNI. So, I
should point out this is not the Joe six-pack bunch..
```

>
>
>What Mac title do you want me to list?

    Something that actually enhances educational effectiveness would be an obvious
    starter...

    Something that makes the hardware expenditure worthwhile...

    Something that lends the remotest support to your point...

>> [deletia]
>>>>   Joe-sixpack is likely to have training in something besides attempting

'superior aptitudes'
>>   are meaningless. Language is a communications tool. It should be used
as such.

              These words should convey ideas. They should do so effectively.
              This is especially true for those who presume to be 'smarter'.
              Such people should be able to effectively communicate with the
              'dumber'. The superior ability of 'the smarter' should make up for
              the inferior ability of 'the dumber' when the two groups are
              communicating with each other.

              If those who presume to be smarter cannot manage this then
              'the smarter' are not quite as smart as they presume.

>? English please, not clichues..

A cliche', perhaps but: it obviously needs to be said again.

Also, I would welcome any 3rd party comments on MY clarity.

If this is the extent of your experience with American education it is
little wonder
you have a 'Bill Gates' attitude towards it...

>should point out this is not the Joe six-pack bunch..

It doesn't matter. Your statement doesn't answer the question.
The characterization of your 1 locus also isn't objective enough to be
useful. It also has other problems but, we wont likely ever get to those...

:       However, with a Tramiel on the board, it probably won't
:       be long before the company goes into the dumper after
:       losing respect from vendors and developers that they will
:       dump on.  Anything the Tramiels get there hands on turns
:       to shit.

:       In the case of JTS, it will be "everything old is new again"
:       all over.

     Not quite. JTS isn't going to be managed by the Tramiels or
anything like that. A couple of them will sit on the board of directors
(along with many JTS personel) and that's about it for the involvment.

You can still run thousands of the apps will run but at a slower speed. As for
the fanatics developing new models, I call it progress. I guess you ST owners
do no know what progress is?

How pathetic.  I advocate real world education.  How pathetic.  I say
if kiddies want to play video games, the parents should buy them, not
the taxpayers.  How pathetic.  I guess I am just pathetic - wanting
return on investment and education for the real world.

>
>                  >> Mark <<

I'd argue with that.  Atari shareholders got 60% of JTS in exchange for their
current shares.  The Tramiels owned half of Atari.  That means they own 30%
of JTS.  Jack and Company aren't going to let the company alone with that
much of an investment in it.  Suffice to say that any Tramiel family member
who wants any high-ranking job at JTS probably won't even have to ask nicely.
---
Speaking of Atari, I recently called them to get a brochure on the Jaguar, and
ask about direct ordering of the Jaguar.  They sent me a photocopy of a file
printing (HTML) that listed Jags at $99 ($50 more than in the shops).  The
address
was in San Luis Obispo, not Sunnyvale.  And the address to send it to was
```

"Go Atari", not "JTS Atari Division." Looks like an old and once great name
in consumer electronics may fade away. Duesenberg, Studebaker, Atari. . . .

Atari Explorer Online Magazine has stopped publishing because Atari will
be no more after they finish selling out of stock. All development,
advertising,
and other projects are DOA.

So yes, Atari has stopped making the Jaguar. And JTS has stopped making Atari
:'/.

>Atari maybe reliable but is it relevant? Is there credible apps and is
>internet ready?

Atari being reliable is relevant as far as it being a long-term purchase that an investor can count on...There are many credible apps and sure, it is Internet ready-just add modem, CAB or Oasis, mix well, and voila'!! :)

The same way you would have to add a modem and software to the LC...

>Price quote in U.S. currency.

Then you were mis-quoted, or mis-read it...

>Does not matter what you want, is irelevant! What about what schools want?

This thread is confusing, and sometimes hard to follow I'll admit--but if the schools already "want" a particular system then anything you or I say is negligible, correct? I'm only supporting what other Atari users have been saying-that if a school system already has an ST setup, then it is viable for continued use, and is worth upgrading if necessary. :)

I use an Akai S2800 with two keyboards and an Atari ST running a Korg program called Multi:) I am writing alot of songs, but I can't decide what the next step should be with my limited supply of money.
1.Buy a 4 track and start sending tapes to studio big wigs

2.Buy a sequencer and start playing seedy bars

3.Expand my system (eg. change over to a PC music program or expand the memory in my sampler).

HELP! What should I do. You see I am not sure how much money I need to switch over to PC music making. What would I need to be able to do on screen editing of my Akai samples? And could I ever find a program better than Multi? I hate myself

Jon Burman
jburman@icis.on.ca

p.s. can anyone send me some address's to studio big wigs?

: Yes. There is no reason to continue making more with 75,000 sitting in
: their warehouse.

Well given their total inability to market anything it's not really much
of a suprise. It seems a shame because they had a two year lead over
the competition and totally failed to make any use of it. Does Mr Hoff
or any other party wish to aquire the Jag, I heard rumours to that effect
a while back.

Rod

>>
>
>You can't comprehend!

        Such a comment is only a convenient way to avoid the fact that you
        cannot communicate (or just wont).

        Excellent is not quantified.
        What is excellent is never specified.
        Two variables are stated as responsible for the effect.
        The sample is stated as being highly atypical.
        NO criteria are ever stated.
        (and no, 'it gets better' doesnt count as a valid criterion)

Try to respond again after you've mastered enough of this subject to actually
understand what it was that I posted above.

Of course you'd hate to have me on the board. I'd make you look like
an undereducated moron the moment you were presumptuous enough to lecture
outside of your element.

>Hogs the machine? In what way? Is it relevant?

Disk space.
RAM space.
Processor Cycles.

A nasty tendency to NOT yeild the CPU.

The machine quoted had a CMT OS, small RAM, small disk and a slow, old CPU with no FPU.

Again... I would be curious to see you actually use the setup you are advocating.

I have little doubt that you would not tolerate it for your own personal use...

```

A question for Mr. Sinclair Day ...

In rec.games.video.atari, you constantly bash the Jaguar (even though it's not an advocacy group and even though you've never seen a real Jag) about the quality of games. One of your favorite assertations is that the games are "8-16-bit quality." Most recently, you claimed that Iron Soldier 2 was nothing more than an 8-bit quality game. I ask you Mr Sinclair ... have you ever seen an 8-bit game? Do you remember what they look like? Remember the small sprites, flickering graphics, 3 channel sound, 16 color, low res screens with one layer of scrolling? Obviously not.

Tell me ... how would you program Iron Soldier II on something like an NES? How would you get 256+ color screens on a machine that's only capable of displaying 13 colors at a time? How would you get such high resolution? How would you create a fast moving 3D environment on a machine that has extreme trouble doing parallax scrolling in 2-D video games? How would you chuck around thousands of polygons a second on a machine that doesn't do polygons? (The Super NES couldn't do IS2's polygons either). How about the 16-bit color used in the FMV sequences? The DSP music? The texture mapping? How would you keep the frame rate at 25 FPS or higher (especially when the NES could do less than 20 FPS with simple shooters)? How would you keep the game from a) flickering, b) breaking apart, c) slowing down? How would you fit a game like IS2 (a cd) or even IS1 (a cart) on a 640K maximum NES cartridge? I'd really like you to answer this.

Of course, Petey has no balls, no knowledge and no Jaguar experience so he can't. He probably doesn't even remember what NES games like Castlevania and Super Mario Brothers look like. But go ahead Peter

```
... prove yourself. Make an NES version of Iron Soldier II. Heck ... I'll
even let you make it on a more powerful 8-bit like a Sega Master System.
Take it away Peter ... if you dare!

Can anyone tell me when the Atari merger will be final? I am also curious to know, who is buying Atari's stock. Is it small investors, corporate buyers, also any predictions as to how high it will go.

Thank You.

Jim Shea

Ooh, Peter goes for the infamous "jeez it's just a game, relax" when proven wrong and backed into a corner. Not surprising.

         Allowing an applications size to grow uncontrollably merely because your
        development system happens to have an excess of CPU, RAM and disk.

        Often (I have personal first hand experience with such a case) no gain
        in utility is achieved for the extra 'bloat'.

     Well... we have breached the spacewall and have entered 'cyberspace'.
     There are certain terms and jargon that apply to the domain. If you wish
     to make comments or policy, why don't you try to actually learn them.

>What is the issue, jabba.

An LC has a small disk
An LC has miniscule RAM (by Netscape standards)
An LC has a slow, old CPU
An LC has a CMT OS

'scape wont fit into the LC's physical memory.
'scape will require VM and hit it HARD
(petespeak translation: it will make it slow)
'scape will tax the CPU expecting a V8 and find a 4 cylinder with no fuel injection
(petespeak translation: it will make it slow)
'scape will do heavy FP math decoding the jpegs and find no FPU
(petespeak translation: it will make it slow)
'scape will do all this and not want to give up the system, even when it is not getting anywhere.
(petespeak translation: it will make EVERYTHING slow)

This is also the case for a wintel clone 486DX/33 4M or less...

>

```

When was the last 68030 (or lower) specific program released for the Mac?
The ST still has a trickle of new titles, including CAB.

It is a bit less of an orphan than a Mac LC in this respect.

>

That is why I have constantly advocated the proposition that the older
wintel clones and macs would be limited to the software that was released
in the same 'era' [as the older machines].

>
>>   Just think what they'll think of Apple afterwards...
>
>And you? The ST would be better?

That vastly depends upon the applications. There are plenty of atarians
here to
provide information on the atari side for comparison and only one raving
mac
advocate: you.

Without the input that you have evaded thusfar, no comparison can be made.

>

>have your nose up your ass, Jabba?

MC68030 != PPC601

The relatively lower performance of the LC will limit what can be done with

it
and restrict it's usable [pragmatic] software base.

[deletia]

Hi All,

Just to let you know about the first meeting of Wessex Atari Group

DATE: Monday 10th June 1996

TIME: 20:00

PLACE: Leigh Park Community Centre, Havant, Hampshire, UK

All Atarians are welcom :-) Please contact me if you need directions, or if
you just want to let me know your coming :-)

I can be contacted as below, or voice on 01705-611847 :-)

Hope to see you all there :-)

Yours Roy

Hey Marky, Iron Soldier II is vapor.  Considering the history of Jag games, the
quality may not even exceed 16 bit quality.  The producers of Donkey Kong on
the SNES could bring a version to that console..

: Not necesaary...I was lauding the 'impressiveness of the other 'quality' titles
: on the Jag:-)

     Too bad you've never actually seen or played any! :-)

: Marky, the Jag titles are just impressive as the first generation titles on the
: SNES..

     Really Petey? Do you remember what first generation SNES titles
looked like? Flickering ... slowdown ... lotsa problems. Show me a SNES
game that chucks around as many polygons as Cybermorph or with graphics
like Trevur Mcfurr (the first two Jaguar games). And those aren't
particularly good titles. Only a few games look "16 bit" ... most have
enhancements that the Super NES could never pull off. Of course ... you
know little about that 'cause you've *NEVER* seen a Jaguar. :-)

     Oh ... and I've taken the liberty of removing the cross-post you
put to r.g.v.a. They don't want to see your lack of nettiquette any more
than they have to.

: Hey Marky, Iron Soldier II is vapor.

IS2 is unreleased. It is *FINISHED*. Screen shots have been produced, the game has been shown running and there were segments of it on dealer tapes. Big difference.

: Considering the history of Jag games

What do you know about all 50+ Jaguar games? You've never seen a single game and yet you bash them all. You take a few select examples and claim that the whole library is like that.

, the
: quality may not even exceed 16 bit quality The producers of Donkey Kong on
: the SNES could bring a version to that console..

DKC was impressive for a Super NES. Given the enormous budget (it was one of the most expensive games in history) and the fact that it was a fifth generation SNES game, it looked good. But ... I think you need to understand something about "16-bit". The 16-bit system could not throw around the polygons that Iron Soldier II does. It could not texture map like IS2 does. It could not produce sound like IS2. It could not produce the FMV that IS2 does. It could not put that many colors on screen at once. It could not maintain that 3-D environment.

DKC was impressive, but it was nothing more than a well crafted 2-D side scroller with a good use of a limited palette and some SGI rendered sprites. IS2 is way out of the SNES and Genesis league, as was Iron Soldier, and as are many other Jag titles.

When did they release Donkey Kong for the SNES? I'd imagine it wouldn't be too hard tho... Although I wouldn't want to compare a 10+ year old game to anything contemporary. You could even implement Donkey Kong on the ST. (There was a great version of ST Joust btw)

Interesting how you are retreating from 8-bit to 16-bit on your
characterizations

Sheesh..The industrial age concept that many schools use today was appropriate
if your career objective is to work in a factory were standarization is the
key.  The U.S. and much of the world is in the Information age were as one
needs to think, reason and constantly change to new environments.

This would be an issue on the ST platform, were the hardware is 1980's vintage. Have you priced a Pentium/PowerMac lately?

I see Oasis and CAB are innovative, but Netscape isn't? Can these wonderful ST browsers compatible with Java, quicktime and real audio?

What a bunch of shit Jabba.. Ever hear of Mac usergroups Jabba? Lots of em
Jabba. Plus there is the mail order UserGroup Connection which is a Apple
contractor to sell Apple refurbished products at great prices to members of
Apple recognized groups. Try usergroup.com on your Atari web machine..

     The only catch is that PC-cheap is cheap relative 3K systems.
     Also, those cheap systems have significantly less computing power.
     Any graphical web browser is going to soak up quite a bit.

>pretend that $70,000 is required to access the web in "pretty color" and

     70k is required just to run 'scape, mosaic or explorer. The pretty color,
     unfortunately, has to go through those.

>
>That is really juvenille.  You KNOW that I meant more than a card.  You
>were just spouting off again, that's all.  VERY stupid; VERY typical of you.

      The card has to plug in somewhere. The hardware requirements of a machine
      to plug that card into, one with enough power to run a win browser, are not
      cheap. (despite how loudly you may protest it)

      They would unlikely be cheaper than even an ST video board.

       You were still conveniently ignoring the cost of the system into which the
       video board would have to be plugged into.
```

So why weren't Falcons used? Apparently some MIS guy decided the
software they needed didn't exist. Can your Falcon log in to an NDS
Novell 4.1 server, for example?

>See what I mean?

Not really. Win3.1 has problems, sure, but everything under the sun
runs on it, and the updates and new software come out first for it.
They're easily sourced from a variety of vendors, and support staffs
for them are plentiful and knowledgeable. They network easily, and
they're continually being innovated, something I can't say about the
Falcon.

Agreed. For this application, I would not recommend TOS systems. However, I would take a look at the following:
-
1) System instability.
Windows NT for Workgroups would clear up much of the problem. It is expensive, however, it is stable.
-
2) Open systems.
A move toward PPCP or other open standards would reduce reliance on employees' machines.

Re: Intel "innovations" vs. Falcon ones
The Falcon is innovative, and being innovated upon.
"Innovation" in Intel-speak means a boost in CPU speed, period. Innovations under TOS are primarily software-oriented (though the upcoming res-booster from Black Scorpion Software looks interesting).

The primary utility of TOS in a business environment is definitely NOT in a Novell-network situation, but rather, in a small business setting. Usually, my less-computer-literate small clients find Best Business Management combined with AtariWorks to be a good starter system. They can, with Calamus 1.09N, design brochures for their business, and generally get started for less money and less aggravation than a PC. Of course, I also primarily aim TOS machines at creative customers (those offering creative services that require an inexpensive, highly-flexible system). And many shops I've worked with adopted TOS before I got involved with them, becoming TOS "legacy shops."

I came up with an interesting proposal for "internetworking" for larger clients that would allow the usage of e-mail and most other distributed systems (other than workgroups and networked software like MS Office). Since most companies that have multiple platforms based upon user preference (SBT systems on NT for accounting, Macs for graphics, Falcons for multimedia, etc.) are more productive, using TCP/IP based central systems with decent security via a high-speed digital serial network would allow full access to e-mail, file sharing, and other such necessities. It would also eliminate much of the proprietary problems encountered (like getting a Novell network at one site to "talk" to a Banyan Vines network at another). It also allows for quick adaptation of a WAN. And it's cheap.

James,

Why do I "pretend" like Brian has been "sweet?" Perhaps because, as usual, you started the name calling? Do you really believe that it makes me "sensitive" to expect a semblance of maturity to be used on the Net? Sorry, I didn't realize that proving my manliness entailed acting like a first grader.

I will stop talking about your name calling, though, because apparently you want people to remember you for the 1% of substance in your posts filled with ranting and "heh heh"s. If you want to again get back to the issue of using STs in education, I would again like to point out that not even half of schools have Internet access. Out of these schools a majority of them merely have Lynx access. Now, James, explain to me why an ST cannot accomplish this task.

As far as your close-mindedness, how many times are you going to imply that Toad is the only Atari dealer in the States? It is hard to argue about anything else when you will not acknowledge simple facts such as these.

As far as your past Mega ST advocacy (you really don't remember how you wowed your friends with demos?) it kind of speaks to your credibility. Your advocacy of the Mega ST in times past at least rivaled what Brian has been saying. Accusing us of being "Atari nuts" is rather silly given the circumstances.

I have never said that Windows 3.1 is unstable. Netscape for Windows is but that is another matter although it does relate to the current argument.

Sorry I didn't keep snippets of your past Mega ST cheerleading.

Even though you were a fellow "Atari nut" I didn't find your tripe worthy of saving.

James,
In the past you had monumental arguments (okay, shouting matches)
where you did argue that the PC is hard to use for the beginner.
You claimed that newbies would be overwhelmed by autoexec.bat
and config.sys files. Now you claim the PC is easy-to-use (or
at least not hard). Which is your current opinion? Is the PC hard
or easy?

Fair point, but this approach is not cheap. The big sale point of the ARM is high performance with low cost with low power consumption. The x86 designs can currently score on two out of the three for any given chip - but not all at once.

A free clue: GEM had 24bit color support long before ms-windows.
Only the standard ST hardware has the 4bit limitation.

>to do so. It an insult in 1996 to even consider sing anything less than 24 bit
>color or higher on any system. Why dick with 16 colors. my god my old TI994a

The only thing 8-bit or better color is really useful for is photographic
images. Even those can be quite decently viewed with 16 colors
(greyscale).

Also, not everyone has the 4megs on their graphics cards it would take
to do
truecolor at the resolution pages are being designed for these days
(1024x768).

>had 16 colors 6 years before the fucking ST even came out.

For stills, the limit is 512 colors: NOT 16 btw.
For pretty pictures, that is more than adequate (tho small).

So? What were those TI equivalents of Calamus & GEM again?
So? How do you view a 256 color gif on a TI again?

Perhaps not easier for the user, though. A GUI certainly has it's advantages. "More inexpensively"? Used 4 meg MegaSTEs w/ SCSI hdd cost 300 US$s equiv. in Germany, and they ship with a fast serial port.

There is no mention of Win95 in your original post. You were writing about
the first OS from MS that had a flat memory model, and that's not Win95.

: >: The ST can fully address it's entire physical memory space without

I did read it. Why are you so reluctant to answer my question?

Regards,

Martin.

>>> I don't think my Falcon is obsolete.

>> Then a Macintosh SE/30 isn't either.

>Wrong, a Macintosh SE/30 can not do the third of a falcon do.

The issue is not what the individual systems CAN DO, but whether or not the individual systems are "obsolete".

Based on the arguments presented here, my Ohio Scientific Instruments C1P computer is just as viable as an Atari Falcon030 since it still plays my favorite Star Trek clone game.. in other words, it's not "obsolete" until it fails to play the game I want to play.

In that respect, an Atari 520ST is not "obsolete".

Unfortunately, the rest of the world has a far different definition of what "obsolete" means.

He he he...I have not encountered a Fat Mac and SE/30 in a school in years.
Last Thursday in a small town called Hudson, nine miles from were I am at has
one k-12 school with one elementary and high school media center. Both centers
were equipped with lots of PowerMac LC 5200 and LC475 all hooked up into the
Alexandria catalog. Some were wired for the internet. Across from the H.S.
media center is the Technology lab filled up with LC5200's.

When leaving, a new high school is being constructed across the street. Will
be wired for everything including the Iowa Communication Network Center that my
school has.. Education is an investment not a expense.

>>

>or not the individual systems are "obsolete".

Since you've not defined "obsolete," a word with a strongly negative
connotation, it is futile and fallacious to attempt to argue about it.
---

>Based on the arguments presented here, my Ohio Scientific

>Instruments C1P computer is just as viable as an Atari Falcon030

Yep, the Ohio Scientific Instrusments C1P is completely non-obsolete. Every
month, I trot down to Barnes and Noble to pick up C1P Format Magazine,
and read about Apex Media for C1P. Recently, the latest release of
MagiC for C1P is thoroughly up-to-date and looks great. Not to mention
the new C-LAB machines based on its architecture and countless other
new products available for it on a monthly basis.

>since it still plays my favorite Star Trek clone game.. in other
>words, it's not "obsolete" until it fails to play the game I want
>to play.

>In that respect, an Atari 520ST is not "obsolete".

AN Atari 520ST is also not "obsolete" if it is capable of running the
newest applications available for it, right?

>Unfortunately, the rest of the world has a far different
>definition of what "obsolete" means.

Most of the "rest of the world," as you surreptitiously refer to it as,
uses machines that Micrsofot/Intel/Apple and other manufacturers define
as "obsolete" every day. 386SX, 486, Mac 68K and other machines are all
running newer software, at locations across the world.

Except that "useful" doesn't mean fulfills the necessary requirements, it means "a new toy."

> Plus if there was only 15-20 students, 3-4 students per machine increases collaboration.

So that the smart students are held back by other students, and are forced to all go at the slowest imaginable speed. In high school, I hated this problem. In college group work, it was more bearable, since we set the parameters and weren't assigned to anyone. In both situations, its primary purpose is to make it easier for the teacher to grade. The end results, in an elementary/high school environment, is to stunt all learning down to the speed of the slowest student. This is an unfair "solution" for all students involved.

> I wasn't aware that I would have ST's from the beginning. If I was going to install from scratch, the ST would not be on the list of must have..

Well, you obviously weren't paying much attention to the discussion. Not that I'm surprised. . .

> The situation is that the local AEA does not have ST software in their collection. What use is a platform without apps that the other platforms take for granted?

Oh, boy, we've got bureaucratic governmental acronyms like AEA to deal with now.

-

Peter, in most primary schools, the software is purchased by the school. I can also say that most schools are shameless software pirates, purchasing one copy of software for 200 terminals. Software access won't be a problem in a realistic sense (though I don't condone or support piracy). Assuming the each school district has budgeting allocations, it simply includes provisions in the budget. And the budget I came up with included software for every terminal.

> school has.. Education is an investment not a expense.

Agreed, but I trust parents far more than government as "investors." In addition, investments have a return. If the utility gained from the $70,000 expenditure doesn't at least equal the return in education value, and is not the lowest cost option, it is a poor investment. If you are going to use business terms to describe runaway, uncontrolled spending, you'd better be prepared to use business terms to defend your position.

No problem, you've already admitted to not having carefully read the posts.

>And you know how to define usable equipment? What are your credentials? Do
>you have any education credetials?

"Education credentials" - education in a state-run institution, primarily
funded through taxation of others. In addition, membership in a local
socialist party (such as the Democratic Party) is helpful. People experiences
in the private sector need not apply.
-
Too bad these credentials continue producing results that are the fastest-
falling on the planet.

```

- TTs, Falcons, MegaSTEs and STs with newer SCSI host adaptors have no problems with parity, it's just that at least TTs won't boot from drives that require bus arbitration (if their ROM is not patched first), as they have no ID.

- Stylus printer drivers are available, the most common one ships with NVDI 3/4, which also supports construction of your own driver using MAKEPRN.APP.

- the voice mode of modems is pretty similar even in different models, as the modem does most of the work. As CoNnect 2.46 supports voice mode with ZyXel E/E+ modems, and 2.60 is on the way, that "problem" will vanish. I don't know about other software, though, anyone here with STalker experience?

<nitpick>
The original 1986-era GEM also ran on Amstrad 2086 PCs, an XT-level
computer (ie it had an 8086 CPU)
</nitpick>

When I was shopping for a computer, (1987-ish timeframe) I seriously looked at that model, but chose a 1040ST over it, as the ST fit my needs better than the PC-XT and AT of the day.

My 1992 TT still fits my needs very well.

Scott, I think the problem is not the absolute number of Atari dealers still operating in the US, but the proportionate number compared to dealers supporting other computer platforms.

When an "average computer user" of ANY brand of computer has a problem, or wants to buy something new for their system, where will they go for help?

In the case of a more well supported computer platform, help is likely to be available within a 10 minute drive of where they live or work.

In the case of an Atari system, there are more likely than not, NO Atari dealers in their entire state.

Unless the system owner happens to live near the couple (three?) of Atari dealers still in operation in the Sunnyvale/Silicon Valley area, or near the one still running in Ohio, or the couple on the East Coast, where will they turn..?

How will the system owner even KNOW about these few remaining dealers..?

The Atari print magazines published in the US used to maintain lists of the surviving US Atari dealers, but those magazines are all gone. The Atari system owner in question can't even go to a local newsstand and find a magazine that lists places he can contact in the United States, let alone in his particular state, or even locally to him.

Although I haven't tried calling Atari Corp lately, I highly doubt they'd be much help. One CIS Atari Forum member reported calling Atari for information about his Atari Falcon030 and was told to get an IBM system. At the very best, anyone would probably be referred to Toad Computers, thus reinforcing the impression that they are the only effective Atari dealer left in the US.

Where will Joe Shmoe, who just bought a Mega STe at a garage sale, find out about ANY of these few remaining Atari dealers?

(Scott.. these are not just rhetorical questions.. I'm interested in your thoughts about them.)

Joe, I have been reading the advocacy thread with great interest. Yesterday, I loaded/unzipped and installed two dozen programs on a PC for a friend. That whole process really throws him. I still don't understand why Microsoft hangs on that weird "tree" thing for displaying disk contents. I have seen very capable people get very frustrated with the whole thing.

Today, I am knocking out a display for patient skin care for a local hospital using Pagestream on my MegaSTE. I was telling my 7 month old daughter that she would come of age in the third millenium and it would be very strange indeed. Now, I think not! I still won't be able to afford a decent computer for her to drag off to college. Funny!

BobR,
You certainly have a point. For instance, I personally have no Atari
dealers within reasonable driving distance. I am not arguing that
everyone can simply pop down to a local Atari dealer.
That said, there are two Atari magazines in North America- ST Informer
and Current Notes. I have heard from Rod MacDonald at ST Informer
that Atari Corp. refers users to his company. Anyone pointed in
that direction has access to lots of mail order firms.
Anyone who has Netnews access can easily get support. I have always
found the people on comp.sys.atari helpful.
As far as local support for PCs, I agree that one can easily
buy software locally. However, the places most people buy software
from (Software Etc., Electronics Boutique) are not going to offer
much support anyway. Most users are stuck if there are no competant
PC users around. Furthermore, many people in the PC world turn to
mail order as evidenced by the popularity of Computer Shopper, etc.
The PC can be serviced locally, but how much of a computer's life
is spent in the shop? It is an annoyance sending an Atari out but I
don't think it is that big a deal.
I would actually argue that Atari support is better because the people
still dedicated to the Atari care more about the system and its users.
Big chain stores like Lechmeres will most likely not help install
that new commercial game or setup a bootdisk for you.
My argument wasn't to prove that Atari dealers are all over the country
but to show there was choice and Toad does not have a monopoly. I
can shop around for the best price on items from a variety of Atari
dealers. By saying that Toad is the only dealers, it implies that
if Toad dies all Atari users are left high and dry while this is
just not true. I have dealt with a variety of dealers.
I hope I answered your question. I was angered by the huge
generalization (all Atari users have to go through Toad). It is
equivelent to me saying that Windows is a bear to use and crashes
all of the time based on what one friend told me.

John,

No, it's not funny... It's sad. I remember back to the early days of
personal computing when it looked like before long all com
manufacturers would have VIC-20 prices for some of their machines...
of course they wouldn't have the latest whiz-bang processors, but they'd
be good enough to get by with. Alas, this is not to be the case. No
matter how fast manufacturers make a machine, software engineers will find
a way to slow it down to a crawl.

See ya,

You took all my comments and twisted them around. I said i had 16 colors like
you so love, years before the ST came out. I never said that it had
equivalent software on my old thrown out TI99. No matter what you claim, you
are just faking the amount of colors on screen. You never have more than tha
actual 16 colors displayed at once on screen on the ST. Why in the hell would
you want to use 8bit color for PHOTOGRAPHIC quality pictures. You probably
still play with GI Joes and have a pet rock under your bed. Aggreed the falcon
broke out of this limit but, only a handfull have them.

Actually, I saw benchmarks for the test verion of the StrongArm. It was slower than a MPC604 @ 150MHz. This wouldn't make it "considerably faster" than the Pentium @ 166MHz. And, of course, it would be considerably slower than a PentiumPro.

That's what I said, asshole...

Must be awfully hard to think, when you're a Super Hero cartoon character, eh..?

By the way.. be careful using big words like "multiplexor".. you might hurt yourself. Not to mention the MIDI adapter cable has nothing to do with multiplexing anything.

Not such an expert as you'd have everyone think you are, eh Cartoon-Boy..?

Oops.. I forgot.. I wasn't going to talk to anyone who pretends to be an action figure.

Go play with Princess Leia...

Business is a generic term? What business are you referring to? Private
schools? The reason private schools are better and you should know this is:
Private schools spend twice as much per pupil, smaller classes, competent
teachers and can pick and choose who they accept.

Public schools = public money and by law cannot keep out students regardless.
I am all for private schools and I may want to work in a private setting. But
I draw the line to public financing unless private schools accept all.

Why is it unfair?  There is not enough machines to go around due to budget
restraints.  Life is not fair...Your teacher most likely had to many students
in the class and to improvise under poor working conditions.

You said that $70,000 is a wasted investment. You may have valid reasons that
this kind of spending is wasteful, but from where I am it is not due to having
competent staff and appropriate curiculum.
 I trust the professionals over parents in many cases.

TI994a >

I'd like to see that TI994 do what the ST did with those 16 colors. And by the way, could the TI machine do what Spectrum 512 did? My guess would be no.

>>
>>>had 16 colors 6 years before the fucking ST even came out.

Did Macs and PC's of 1985 have the graphics capabilities of the ST? None that I ever saw did. Again, you can't compare 1985 technology to 1996 technology.

>>
>>   For stills, the limit is 512 colors: NOT 16 btw.

>equivalent software on my old thrown out TI99. No matter what you claim,

I think his point was that yeah, the TI had 16 colors, heck so did my Atari 2600, but the quality of the machine is what counts here. Did your TI have a 512 color palette? Was it capable of doing as much. See this is what I mean by comparing technologies of different eras. The ST was light years ahead of what was out in the previous years. So it isn't a fair comparison.

>you
>are just faking the amount of colors on screen. You never have more than
>tha
>actual 16 colors displayed at once on screen on the ST. Why in the hell
>would

Well, I don't care whether my ST was faking it or not, I DID get a rock-solid 512 colors on my screen at once. No flicker, no funky dithering, but pure 512 color displays through software like Spectrum 512. And with Photochrome you could even "fake" 4096 colors on an old ST, with a bit of flicker, but still a very nice picture.

>you want to use 8bit color for PHOTOGRAPHIC quality pictures. You probably

He said 8 bit OR BETTER. I agree 8 bit graphics is quite lacking. So how about 16 or 24 bit? That was included in his statement. He wasn't limiting himself to 8 bit.

>still play with GI Joes and have a pet rock under your bed. Aggreed the
>falcon broke out of this limit but, only a handfull have them.

I know of more Falcon owners than I do ST owners. And more are getting these and better systems now that C-Lab, Medusa, and other companies are developing new TOS machines. And the Falcon wasn't the only one to break the 16-color "limit" (Which really wasn't, but I'll just go with it). Look at TT. And I don't know what prompted the ET4000 discussion, but I know that there are a bunch more graphics cards than that old thing available. So I am quite content to own a Falcon, a 1040STf, and a 1200XL (and it still works!!!).

One good twisting deserves another. You can take any one characteristic
of anything and make demented points from them.

>equivalent software on my old thrown out TI99. No matter what you claim, you
>are just faking the amount of colors on screen. You never have more than tha
You haven't the faintest clue what you are talking about. If the level
of
color is percieved then what is the difference whether those colors are
'real' enough.

>actual 16 colors displayed at once on screen on the ST. Why in the hell would
>you want to use 8bit color for PHOTOGRAPHIC quality pictures. You probably
One can effectively fool the human visual system at that color depth.
As to the usefullness of such a thing: I was not the one advocating use
of such things strongly. So, your following comment is mostly
gibberish.

>still play with GI Joes and have a pet rock under your bed. Aggreed the falcon
>broke out of this limit but, only a handfull have them.

Your pathetic attempts at insulting me don't change the fact that a stock
520ST (no f, no m) can display 256 color stills, runs on a 32 bit cpu, has a flat
4meg address space, does device to device DMA, has comfortable DMA
thruput (1.5 m/s+), has a serial hardware capable of handling the thruput of
contemporary analog modems,a GUI, applications to run under that GUI and
computing power necessary to run them with a civilized amount of
responsiveness.

The un-ST crowd around here for the most part seems to be holding
the useful='new toy' mentality. It seems you're joining them. Useful is
a fairly simple term with a rather straightforward meaning as long as
Orwellian linguistic gymnastics are not used.

If the schools objectives, in any endeavor, are stated in a manner so obtuse

```
         as to be incomprehensible by the majority of the parents, than those
         objectives are too complex. Such obtuseness also hinders useful
         accountablity.

              Anyone should be able to glance at the project and see how
         well it is meeting established goals, or if those goals are even worth-
         while.

This would be true only in the 'hood as that is where you must go to
find parents generally less educated than 'professional' teachers.

Hey dumbass...I never said it was. You're just talking out your ass again. Please...my challenge to you....QUOTE ME on saying that "Toad is the only Atari dealer int he States." Go ahead. I dare ya. Ok....now SHUT UP.

> As far as your past Mega ST advocacy (you really don't remember
> how you wowed your friends with demos?) it kind of speaks to
> your credibility. Your advocacy of the Mega ST in times past
> at least rivaled what Brian has been saying.

Yeah....the demos are still impressive. Now, Scottie....SINCE YOU THINK YOU HAVE SOME BRILLIANT POINT TO BE MADE.... Rather than vaguely blather about "it kind of speaks for your credibility," why don't you give some SPECIFIC EXAMPLES and HARDCORE EVIDENCE of whatever misguided point you THINK you're on to. I want to know what the alleged contradiction is that you've been pissing about for so many posts yet never seem to uncover. Maybe after you realize you have no point, you'll put a cork in your ass and shut up about this too....but I'd be surprised.

> Accusing us of
> being "Atari nuts" is rather silly given the circumstances.

Sure it's rather silly....rather silly under your circumstances....from your viewpoint....AS an Atari nut.... I'm sure YOU think it's rather silly. Heh heh.

> I have never s
> Even though you were a fellow "Atari nut" I didn't find your tripe worthy
> of saving.

Yeah...convenient excuse from you....you accuse me of something and then when it comes time to prove it, you duck with this.... good try...
Ain't it interesting how this scenario so conveniently meshes with the fact that YOU HAVE NO POINT and you're just spouting.

James

James,
Oh, so you admit that getting on my nerves is your intent?  What a
noble goal.  Listen, if you have nothing of use to say, why not leave?
You'd be doing everyone here a favor.  If you really think that
you've annoyed me, fine.  Live in your little dream world.
Of course, I don't think I've ever encountered another person get so
emotional in comp.sys.atari.advocacy posts as you do.  Brian
offended you by disagreeing with you?  Awwwww, poor James.
I also love how I am an Atari nut simply because I agreedwith Brian
in one post.  I've got news for you, funboy. I could not know a lick
```

about computers and still find your antics and childish namecalling
worth calling you on. What other reasons do you have for calling
me an Atari nut? Because I own a Falcon? Please.... Since
you seem to love "hard evidence," give me an example of where I
said the Atari was the greatest platform. Oh, you can't? What
a surprise. Heh heh.
What have a been trying to prove with my posts? That you are a
hypocrite, James. Everyone here long enough will remember
your Atari cheerleading. Yet, I am the one who is an Atari nut. Why?
Because I disagree with you on some points (I do agree with you on
others).
You may have never said "Toad is the only Atari dealer in the US"
but you keep mentioning Severna Park, Maryland. Base your
arguments on semantics, if you wish, but people realize the implications
of what you are saying.
In a year, I might ask for hard evidence, so clip this out, James,
and store it on your hard drive.

Where is everyone? I leave for awhile and this area is dead..

By the way, you can pick up 8/16 bit color LC's with HD for under $200. So LC's with internet capabilities render the ST a bad investment..

Ah...$200.00...Umm, would you mind listing the specs. for that machine? Ram, hard drive size, video rez., and does that include a monitor and the software to access the Internet? Thank you...

Nothing personal, but -nobody- on Gods green Earth will ever convince me that my Atari equipment have ever been or ever will be, a "bad" investment...I own a Lynx, Jaguar, Mega 4 ST (runs my BBS), STe (games for my 5 year old) and my Falcon 030 that takes me wherever I want to go...Just one man's humble opinion... :)

Performa 405(aka LCII)
16 mhz 030
4 mb ram
80 mb HD

Nobody is asking you to do so. The original question was if its a good idea to buy used obsolete ST's for schools. My criteria in evaluating is the same with school materials. Others stated that schools should get the lowest denominator and that Powermacs and Pentiums are a luxury and waste of tax payers money.

I see the widening of the gap bewtween a technology driven higher ed and public k-12 schools that are way behind..

Hear, hear! Precisely my point. But why another platform? Same platform,
better hardware --- why not a used TT or a Mac with MagicMac???

See ya

Hi, How is it possible? What are the features of the LC?
Is it better than the Falcon?
BTW when the guy said ST's for free, that's true, I have a lot of friends
who gave their STs, and on the net you can find some for $25 bucks, so I
also considere that price as free.

The StrongARM is consideraly faster than the Pentium. And considerably cheaper and cooler-running. There are going to be some amazing new desktops, notebooks, and other machines not yet conceived based upon this architecture.

Why didn't your employer get an Atari Falcon (or rather, 100 of them)
and Falcon WP/DB/SS/Pres software for all of the users? Apparently
there was a -reason- for doing what he did. What was it?

Thats funny. Its the opposite here at the local high school. This "media Center" utilizes the expensive equipment. Looks like those schools did not plan and not the right people involved. Yes, I have been to quite a few that have Workgroup servers and the whole nine yards.

Obviously you have never done research. Of course, based on the general lack of intelligence your cockheaded contentions serve to indicate of you, that's not surprising. "Lucky if they get turned on twice per year." Hah! Equipment that "nobody uses." Hah Hah! Yeah, if that nobody is a dumba** like you.

> Fancy technological equipment does not an education make.

Yeah, and your cheesy attempts at pretending you're and "erudite" are very entertaining. Keep it up!

James

I don't go past the CPU question because anything with a 16mHz processor is far beneath my minimum standards so comparing by CPU is the only relevant comparison..they both have s...l....o...w processors.

> Until you do this, your argument is a vacuous expanse of hot air.

Awwwww....sounds like what I've been telling you the whole time.

I don't know what you're talking about. Try to invalidate my text that you have quoted above. IT'S A FREE COUNTRY AND OPEN MARKET. It's the employer's fault is all that matters. Don't try to dodge that key point by pretending you're intelligent enough to play devil's advocate and do another sidestep.

> You've just validated the entire multiplatform argument from my perspective.

If so, only conincidentally. I just stated the truth, which I never deviated from to begin with. I'll bet you think you're on to something now, eh? You tell me what it was. You habitually fail to comprehend simple concepts and combined with your surly bullheadedness, you've probably been arguing for nothing the whole time. Heh...that would be another surprise!

> When people are permitted to find their own solutions, without a James Woods
> blowing hard about "adherence to standards," and other such manipulative
> garbage, the world shall be a much less unpleasant place to do business.

Hey dill-weed! I never said that people were REQUIRED to adhere to standards. That isn't the point at all. I don't give a rat's ass what kind of computer anyone uses. What I WILL MAINTAIN is that there ARE some advantages to using a PC, and of course being standard is a big one. I DIDN'T SAY that there were no advantages to other platforms; I DIDN'T SAY that there were no disadvantages to the PC platform. Maybe YOU ASSUMED. I only said THERE ARE ADVANTAGES. The reason I said that was because of all the PC Bashing that you do; telling lies like "bugs as features" for Windows software. That is totally ridiculous bullsh*t. Yes, I'm sure you'd like to call it "blowing hard" when you're WRONG and the other party is opposing you. You erroneously seem to think that your opinion is worth more than anyone elses. Grow up....this is usenet....

I really didn't care what it "seemed to you." You brown-noser. Of course you're going to agree with him. You're a couple of Atari nuts and your message only serves for you to kiss his a** for agreeing with you. Why don't you do something with the balls while you're down there? Careful...he might stop suddenly.....

Of course I disagree, you dodo.
My "engagement in obscene/vulgar insults" is demonstrative of nothing
more than the fact that I have ZERO respect for you. Duh!!! You must be
the one with "lack/failure of mental capabilities" or you'd have figured
out an easy one like that!

> Your psychological-emotional
> connection between TOS and Sam Tramiel is but one example of this.
>

Hah!!! You are obviously trying really too hard to generate an arguement.
"psychological-emotional connection?" Heh heh heh...you dumba**.. Who
are you pretending to sound like now? I was joking..... You take things
too seriously...hee hee... but that's okay because it's so funny to watch
you go off in so many crazy directions....

No it's not, dumba**. I still say that the ST is easier. I don't say it's better. I never said what was better. I just won't stand for the bullsh*t lies that you make up about PCs to try and make them sound so bad and perpetuate your denial. That's it is one sentence. You dolt; if you'd have understood what I said to him (above what you quoted of me) and were properly prepared to reply (you never are) then you'd have answered my question and SHOWED ME what was contradictory....all you did was spout off again.... So what was contradictory?

> >
> >Only if you ask me NICELY. YOU HAVE TO ASK NICELY.
>
> What arrogant pap.

Yeah, you seem to like that word ("arrogant") ever since I told you that arrogance was the most salient of your virtues...heh heh.

>
> My predicition: if Mr. Tirrell (sp?) engages in an argument with you that lasts for a while, after six posts, you will engage in multiple insults when your psychological-emotive connection between TOS and Tramiel cannot be justified by the facts.

The above is so stupid (particularly the latter part) that nothing further will be said about it.

> -
> Really, James, let it rest. Until you can describe specific applications that the PC does and doesn't excel in, what replacements are available, and how much they cost, you will be continuing the blowing of noxious hot air that has given you such a poor reputation on the c.atari newsgroups.

#1 - You're the one who thinks he has a reputation to protect. I don't. I don't care.

#2 - Obviously, you wouldn't have mentioned reputation if it wasn't important to you. Also obvious, since you oppose me you think you're right and that you have an opposite ('good') reputation.

#3 - Conclusion...."YOU'RE NOBODY!!!" Otherwise you'd have a life and worry about that instead. Get real....an Atari advocacy newsgroup....and you're trying to be the MENTOR and hero here... HEH HEH HEH!!!!

I just come here for fun, you cretin. I told you already.

The only reason you want me to mention specific applications is because you want to get into a a quibble-piss about them in a cheesy attempt to qualify your ridiculous opinion. The PC doesn't have to be the best in everything; just good in a lot of things. That's what it is. That's all I say, however that's good enough. Evidently MS Office, Pagemaker, Photoshop etc are good...since they and the platforms they run on are standard and wouldn't be if they didn't. Did I say it was theoretically perfect? Do I give a damn? No. Does that mean it's bad? No. Hard reasoning for you? Evidently, or you wouldn't be so lost.

> card for an ST costs $800. The most expensive I've seen for the single
> box units is around $400 (or 50% of his inflated, fabricated figure).

This has already been cleared up, buttwipe. You know that. I was pricing a monitor to handle all that resolution. A good monitor is from $300 to $400, plus $400 for the Omnicrom (or whatever). That's how the "inflated, fabricated" figure was arrived at. I was since told that the SC1224 will work....as if it will somehow go beyond 640x200. Ok...whatever...assume it will. That still doesn't change the fact that in the last bout of messages, we went through this already. You just wanted to piss some more and I caught you.....

I have to agree with you on this latest advocacy thread. In the PC world
it is "P75 - only $1799.99 (monitor sold separately)". How frustrating.

I keep waiting for some evolutionary change in the computing world (Pacific Rim maybe) that will cause me to loosen my budget (forget the kids braces!) and buy a PC. It is pointless to wax emptily within the PC or Apple advocacy groups. They know nothing of the latest Atari stuff and they probably don't spend anytime playing baseball with the kids, taking long walks or gardening.

I have never really spent anytime using a Mac or PC. The various people that I do help with their PC machines (three at present) are pretty lost when it comes to manipulating programs (unzipping, installing, working with directories [copying, deleting, etc.], zipping, archiving, well you name it). I always help them and their kids always come over to our house to play with the Atari because "we don't have games or music or stuff like that at home" (well, they do - they just don't know how to get to it and, even though I set up the stuff on their machines, they are always loosing the programs [the icons or whatever]). I like the PC and Mac. All computers can have very high learning curves. I just never thought that TOS/GEM had as high a learning curve as the PC and Mac. I only say this because TOS/GEM has always given people easy and intuitive access to the computer. That has helped me when it came to actively participating in various projects on other platforms. Poor Atari! Nolan Busnell tried to purchase the games section of Atari recently and was turned down I think.

So, don't be disheartened by people whose present computer activitites are on a platform "other than Atari". They are probably missing out on some really neat things happening within their "own computer community" by spending their time over here at Atari. In fact, I probably could win a bet on this if I had any money (and if I was a betting man). We could could all have a ham and cheese sandwich if we had any cheese. And if we had any ham. :)

Argh! That'd look terrible. I'd advise to get _one_ Unix workstation, e.g.
a Linux PC, and serial I/O cards with as many ports as possible. As I
said, that machine might also serve as a proxy, ftp, news server and
firewall. Get enough serial cables to connect the STs. But of course that
solution would require some computer literate available.

>2) Buy 25 copies of STalker for $20 each - $500 spent.

I'd prefer CoNnect :-).

: Why didn't your employer get an Atari Falcon (or rather, 100 of them)
: and Falcon WP/DB/SS/Pres software for all of the users? Apparently
: there was a -reason- for doing what he did. What was it?

Thats a silly question. We run a lot of machinery (US$150 million worth) on some terminals using ControlView software (DOS based). These terminals pass data to PLC racks that control the equipment. About half the machines (mostly in Admin, some in other areas) get used fairly often for duties like memo typing, staff notices, spreadsheets etc...The company use M$ because they don't know any better. Our entire network runs from two 486dx PC's with Ethernet cabling/hubs. The network installation of Windows 3.1 has been (often) responsible for the crashing of the file server, resulting in lost production data (production is monitored and data used to grade physical quality of the product we make). If such data is lost, we cannot grade the stuff and cannot assure our customers of a quality product so we lose about US$250 a minute for a dead file server. Big dollars indeed!

I happen to use my Falcon (on the odd occasion) at work because all the M$ software (including Win95's 'famous' comms software) has difficulty in running via a Novell network to a modem that we use to sd/rd data from our corporate head office. I use my 030 to get software via the net for work by taking my own modem/computer in.

It was a corporate decision to go M$. The next choice would have been Linux or Win NT, but the corporate toss pots decided to penny pinch and go for networked PC's etc...In light of the losses that we make from crashes of our server, I think a bad decision has been made. And the irony of it all is that problems are never blamed on software, but people instead. It is the software that causes the problems, not the poor person typing the memo.

I think 100 Atari Falcons would have been nice here. So do others. Sadly the corporate propellor heads couldn't really justify such frivolity. The buck stops shortly however. Our computer CapEx budget has been halfed, meaning no more expensive upgrades just to keep older 486's up to speed with the new M$ stuff...

See what I mean?

It's been my experience that unless the equipment is directly tied into
research and academic pursuits (ie. it is necessary to use the materials),
it goes unused. Perhaps people in Iowa enjoy watching laserdisk films
on the Kennedy assasination.

>> Fancy technological equipment does not an education make.
>> ---
>
>To you..

To anyone. Education is not smply using equipment. Education is (supposed
to be) skills learned for life that allow an individual to compete and
participate in the capitalist system of the US. Based upon the "educations"
of many people I know (who have no problems writing valency equations, but
cannot balance their checkbooks), the system is failing in many respects.
While not a neanderthal who advocates "return to basics," I also don't thing
that electronic purchases should be made if they do not substantially assist
in the achievement of the educational goal.

>
>This has already been cleared up, buttwipe.  You know that.  I was

No it hasn't (extraneous, expected insult due to lack of argument ignored).
You quote $800 for a video card.  The card is $400.  The monitor is
immaterial to the argument since we were talking about the display card
(which can be used with the omnipresent SC1224 monitors anyway).
---

>And just how many resolutions can you run?   What kind of monitor?
>SC1224?

See above.
---

>Yeah....it looks prettier on a $35 VGA card too.  Pretty looks without
>any "$70,000 expenditure."

That's it. . . we'll replace the STs with VGA cards.  I bet these are
the new Tseng Labs chipset VGA cards with an OS, web browser, and everything
else you need in a single chip.  Just hook up a keyboard and monitor, and go!
You no longer need those minimum $1,200 PC boxes anymore, just the card!
Wow, James, your post has confirmed and sealed your reputation on the
USENET for FUD (which, I understand, goes back to your equally-embarrasing
stint at a Mega ST advocate!).
---
Please, James, get a clue, get an argument, and credibility may yet find
its way to your posts.

And what applications would the user be running that would require the additional speed? Windows 95? Graphics (in which case, the DSP more than makes up for it)? Again, this comparison is another blow-hard Woodspeak.

The utility that the average user realizes from Papyrus (effective
throughput) is the same as that from Word95 on a Pentium. However, the
Pentium requires more power due to the inherent inefficiencies of Win95.

>Seeing how you've demonstrated your genius by telling of your value of
>OBSCURITY in proprietary business computers....ha ha ha!

Um. . . obscure business systems like Solaris-based Suns, Windows NT, and
other systems in a small and medium business setting?
-
Seems more like you demonstrated your lack of knowledge of business computing
by the above statement. Most businesses couldn't care less about "standards."
What they care about is how to achieve goal A to maximize profit by minimizing
cost. If "standards" are a necessary part of minimization of expenses, they
are taken into consideration. However, the success of Sun, Bailey Controls,
and other firms indicate that proprietary, custom systems are far from
dead or useless.

>Mistruths about Windows being orders of magnitude worse than it is.

It's highly stable, which is why Windows 3.11 and Windows 95 are the leading Web servers on the Internet today, right? Well, erm, no. . .

>Mistruths like your value for obscurity in small-business computing.

Businesses couldn't care less about "obscurity" if the equipment is within budget, lowers the cost of getting something done, and especially if it prevents reverse-engineering by competitors. This is why proprietary custom systems still thrive, and why Sun is bigger than most any PC clone maker.
-
Again, utility per dollar, and not "standards" are the primary consideration of small businesses. I've only brought this point up 1,000 times, you call it a lie.
-
OK, businesses do not at all value utility or cost savings from a computer system. In fact, small business buys PC clones not to lower costs and increase productivity, but rather, because they're just plain neat, and OfficeMax sells disks and printer paper for them. Come off it, James.

>Mistruths like your erroneous misconceptions based on your
>inference/assumption.

My inferences are based upon extensive experience in my field, and have been confirmed time and again. Yours are based on a psycological connection between TOS and Sam Tramiel. Who has more ethos here, I wonder?

James,
Your idea of fun is to post in an advocacy group of a computer that
you apparently care little about (you're definitely not here for
information or you'd have an open mind) and to make enemies with
infantile name calling. Who needs the life?
Someone posts one messege agreeing with me and you call it
a conspiracy of Atari nuts sticking together? I am curious;
who do you think assassinated JFK? Yes, James, all of us hail
the fuji symbol and we are infiltrating Microsoft as we speak.
We will soon assassinate Bill Gates and all who oppose us.
Speaking of conspiracies, you haven't even attacked your traditional
enemy, BobR. As long as people agree with you, they are redeemed,
huh? Of course, you are the one who backtracked from claiming
that PCs are incredibly tough to use to "if you can't use one, maybe
you're not as smart as you claim to be." Anything for an excuse
to argue, I guess.
Anyway, I will definitely not personally attack you. I think that
your posts speak for themselves.

So? The CPU clock is only one of many Meaningless Indicators of Performance.
That number may have very little to do with thruput or even real,percieved
performance.

I subscribed to this newsgroup for information. Later, as Roland Miler began the theatrics, it became a form of entertainment. What do you mean "would have an open mind?" Specifically, to what are you referring? Also, while you're bitching about the name-calling (and associated behavior), why do you pretend like my nemesis has been sweet and kind. Do you believe that to be the case, or are each of you in despair, looking for another user to cling tenaciously to?

> Someone posts one messege agreeing with me and you call it
> a conspiracy of Atari nuts sticking together?

Atari nuts, yes. Conspiracy? You just introduced that word. I never said it was a "conspiracy." Hell, I don't take it seriously enough to call it a conspiracy. A true "conspiracy" would have to be highly organized and require participation, and nobody would follow you numb-nuts out of a burning building, so NO, I don't think it's a conspiracy because conspiracy is beyond what you two are capable of.

> I am curious;
> who do you think assassinated JFK?

I really don't care. However, they started killing Kennedys at the wrong end...they should have started with Teddy instead of JFK.

> Yes, James, all of us hail
> the fuji symbol and we are infiltrating Microsoft as we speak.
> We will soon assassinate Bill Gates and all who oppose us.

Brilliant! You're great at making up crappy stories. What else can you do?

> Speaking of conspiracies, you haven't even attacked your traditional
> enemy, BobR.

I haven't seen BobR post anything that I'd argue with. But that's irrelevant. That has nothing to do with "speaking of conspiracies." What is the connection, since YOU brought it up?

> As long as people agree with you, they are redeemed,
> huh?

As long as they don't tell me that (1) businesses value obscurity in microcomputing, (2) that different/less-known is a selling point, (3) that NOBODY uses library media resources, (4) that businesses COULDN'T CARE LESS about standards. Now Mr. Tirrell, you know that it's not merely that "I disagree" with my nemesis, it's that his arguements are so ridiculous......

> Of course, you are the one who backtracked from claiming
> that PCs are incredibly tough to use to "if you can't use one, maybe
> you're not as smart as you claim to be." Anything for an excuse
> to argue, I guess.

Yeah....you guess....and your guess is wrong. You really like to keep *trying* to bring it up like ANYTHING I have said somehow conflicts with what I said about the ST being easier to use. Have I ever ONCE said that the PC _is easier_ than an ST? No. Does that mean that a PC is HARD to use? No. Does the fact that I say a PC isn't HARD to use somehow invalidate the fact that the ST is easier? No. You see, you guys are entirely too one-sided about it and erroneously believe I'm the same way. Just because I won't stand for LIES that Windows is "totally unstable" you assume I worship it and must therefore "hate" TOS computers and have "turned around" in my arguement. Sorry. I use and value many platforms, and I see strengths and weaknesses in all of them. YOUR

MISSION, SCOTT TIRRELL (in caps so you won't miss it) IS TO NAIL DOWN WHATEVER POINT YOU THINK YOU ARE TRYING TO MAKE by continually bringing this up. I have tried to explain it to you and I will try again, if necessary. I await your move, or just drop it if you don't think you have a leg to stand on.

> Anyway, I will definitely not personally attack you. I think that
> your posts speak for themselves.

Oh, you're such a good and mature young man. I pat you on the back. Oooooh "my posts speak for themselves." I'm so insulted....I'm in tears...boo-hoo... (This is all in jest, of course, but I thought it might make you feel better because you're so sensitive.)

James

> other systems in a small and medium business setting?

Those aren't obscure....Those are high-end, and they ARE stanards as such. OBSCURE would be using TOS. We were talking about using TOS as a small business machine. I lamented that the sparse and ever-shrinking base of users, software, and support was such that the platform would not be attractive for small-business use. You tried to turn that - THE DEFINITIVE HANDICAP with using TOS - into some cock-eyed contention that this OBSCURITY is a virtue. Yeah...real virtue when you need to expand your operation or implement changes. Here once again you do a typical Roland-Miler sidestep and try to pretend we were talking about SUNs, etc. Good try, but it didn't work. To refresh your memory (convenient amnesia, no doubt) here's your quote: ["One selling point for TOS systems (especially among small businesses) is the fact that it is different and less known."]

> -
> Seems more like you demonstrated your lack of knowledge of business computing
> by the above statement. Most businesses couldn't care less about "standards."

Rather, seems like you demonstrate YOUR lack of knowledge of business computing with that last sentence above. If businesses didn't care about standards then each business would have a totally proprietary computer....kind of like 20 years ago. I can't believe that although you want to look so much like a know-it-all, you'd say something so stupid as "Most businesses couldn't care less about standards." You think a small business can afford to hire a team of programmers to write their software when they can open a box of standard business software instead, and have no trouble finding employees who are already familiar with the software? Don't look now, Brian, but you're talking out of your nether regions again. You shouldn't try so hard to accuse others of having a "lack of knowledge" because with DUMB arguements like this, you don't look very bright yourself and you DO look quite hypocritical.

> What they care about is how to achieve goal A to maximize profit by minimizing
> cost. If "standards" are a necessary part of minimization of expenses, they
> are taken into consideration.

Oh....another Brian flip-flop. Just above you said they "COULDN'T CARE LESS" (read my lips) about standards. Now you flip-flop. Now they're considered if they "are a necessary part of minimization of expenses."

OF COURSE standards have greatly reduced cost. Why else are they used, bonehead? That's the whole point. With the mass-production that standards yield, economies of scale allow lower costs and thus lower prices. You know NOTHING of economics.

Keep trying.

James

> Perhaps you've helped install them?

What does installation have to do with anything? Oh, you're trying to introduce irrelevance into the arguement because you have nothing more material to say...how wonderfully typical of you, Brian.
What difference does it maked what equipment *I* use? What I have used this year has no bearing on the fact that many people DO use media centers, they are useful, and next time I need to use one, I'll be glad.
The fact is that YOU (in an egocentric bout) said that NOBODY uses them, and you were simply WRONG about it and you want to argue. Of course YOU don't use any resources, since you think you know everything already, why would you need them?

> ---
> Experience in implementation is the best research of all.

Implementation of what? This doesn't change the fact that you said
NOBODY uses media centers, which (of course) is wr-wr-wr-WRONG.

Actually, I wouln't trust you to format disks anyway, but it doesn't
matter because disks come formatted already for "standard" computers.
You should avoid referring to YOURSELF as "we" because the arguement is
with YOU.

>It can certainly do far more than a 10 year old PC or Mac could ever
>have done or be made to do.

Oh, I dunno about that.

Shall we talk about actual, real-world examples here..?

I still have a 10 year old PC-XT clone on another desk with a 12Mhz NEC-V20
CPU chip (plug in installation), an 8-bit buss 640x480 256color VGA video
card (plug in installation), both 1.2 Meg and 1.44 Meg High Density floppy
disk drives (plug in installation) an 8-bit SoundBlaster sound card with

11-voice FM synthesizer, voice input, MIDI ports and DSP chip (plug in installation) and an internal 40 Meg hard drive.

I also still have a 10 year old Atari 520ST next to it with a 2.5Meg memory upgrade (hack, slash and solder installation).

Except for cute hacks like the "Tweety board" which only created a "pseudo-stereo" effect from the internal three voices, and sound digitizer cartridges, I'm not aware of ANY sound system upgrades available for my ST.

High Density floppy drives..? Only with hack and slash "upgrade kits".

Video upgrades..? Except for the one cartridge port plug-in (which I've just heard about recently, have never seen, and have no idea where to purchase), any video upgrade is an expensive hack and slash installation.

CPU upgrade..? Again, expensive hack and slash installation.

Oh.. and considering most of the available space inside the case is already taken up by the memory upgrade, where is all this hacked in hardware going to fit..?

On the software front, the XT and ST are in similar situations. Much of the current PC software requires Windows and 386 protected mode to run, so that leaves out the XT. ST software development however has virtually come to a halt too.

The XT won't run Windows, so it can't run Netscape, but again all the other "solutions" given for the ST (text-only browsers like Lynx, telnet, ftp, etc) are all available for it.

In other words, a 10 year old PC can certainly do at least as much as a 10 year old ST, easier and more inexpensively.

I don't know or care what is the "leading Web server ont he Interet today." Whether or not Windows is or not doesn't change the fact that it is NOT as unstable as you'd like to believe. Of course you're going to spout off/exaggerate/embellish such a claim to try (unsuccessfully, I might add) to support your specious arguements. Of course, you can't understand MODERATION in your beliefs. I don't advocate that Windows is perfect or crap. I merely contend that it DOES WORK and it would not be a standard if it was SO bad. I think you know this but won't admit it (utter arrogance) or else you're really stupid.

> custom systems still thrive, and why Sun is bigger than most any PC
> clone maker.

Reverse-engineering of what, genius? I'm talking about common business software. You think someone is going to reverse-engineer the output from my spreadsheet? What kind of nonsense are you talking about? Small business doesn't need a Sun. Quit trying to hide in the shadows of Sun...we were talking about TOS systems. Proprietary custom systems still thrive? Yeah, like TOS, Amiga, etc... He he he. I wasn't talking "high end" like Sun...you keep trying to associate TOS with Sun..(hee hee) and hide behind it. Good try.

> Again, utility per dollar, and not "standards" are the primary consideration
> of small businesses. I've only brought this point up 1,000 times, you
> call it a lie.

Again, if you can get the software in a standard box for cheap, then that's the name of the game. You think it's cheaper to hire a team of programmers so I can run TOS? You've missed that point 1,000 times.

> -

> OK, businesses do not at all value utility or cost savings from a computer system. In fact, small business buys PC clones not to lower costs and increase productivity, but rather, because they're just plain neat, and OfficeMax sells disks and printer paper for them. Come off it, James.

I don't know what the above means. Are you seriously that dumb, pretending to be? Is that a failed attempt at sarcasm? Are you just dribbling ASCII out your bunghole again? Well, I'll tell ya.....
They buy PC clones because they are cheap, they follow standards, and they have every kind of software and hardware accessory available under the sun, widely-distributed. I DARE you to disprove that statement.

> ---
> My inferences are based upon extensive experience in my field, and have been

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Talk is cheap. Extensive by your own standards, no doubt.

> confirmed time and again.

Yeah, right. Only a cretin would boast that something has "been confirmed" as a supporting arguement. As if that means anything to anyone reading it.....

> Yours are based on a psycological connection
> between TOS and Sam Tramiel.

I didn't say "Sam Tramiel." I said "Tramiel." I don't know what "psychological connection" you're talking about, but it looks like the only PSYCHO phenomenon at hand is your infatuation with repeating this.
I said that "T.O.S." at one time (when the ST was new) was rumored to stand for "Tramiel Operating System." I said that when I saw the "T" for "Tramiel" it reminded me of all the injustices that the Tramiels did for Atari computing. It seems like a very simple notion, and it was an extremely SMALL deal. YOu just seem to get your rocks off with further embellishment (the only measurable commodity you produce).

> Who has more ethos here, I wonder?

^^^^^

Yeah I'll bet you wonder. What do basic beliefs and guiding principles have to do with this situation, though?

> (which can be used with the omnipresent SC1224 monitors anyway).

Lack of arguement? There's nothing to argue. I TOLD YOU that someone
had already made that point and I understood it. You just like to argue,
despite the fact that it's not relevant to anything. Picture the
scenario. Thorsten (or someone) says $900 for a video card. Then I hear
about the Omnicrom for $400 and figure a high-res monitor costs
$300-$400, so it's $700-$800. Then someone TOLD ME that the Omnicrom
uses the SC1224 and I acknowlege it, then you bitch more as if I didn't.
Then I tell you a second time that I acknowledged it and you still want
to argue that it's $400..... Jeesus this is the third time I'm telling
you I know that....now drop it and try to make a sensible, relevant
arguement for once.
> ---
>

> >And just how many resolutions can you run?   What kind of monitor?
> >SC1224?
>
> See above.

YEah, I see SC1224 above, and I knew that prior to reading the above (see above). But you CONVENIENTLY IGNORED the part of the question about what resolution will then be run. How can an SC1224 display higher than 640x200 non-interlaced? Hmmm?? Is it interlaced? What is the maximum resolution and color depth will that $400 buy me when it's on an SC1224?

> ---
>
> >Yeah....it looks prettier on a $35 VGA card too. Pretty looks without
> >any "$70,000 expenditure."
>
> That's it. . . we'll replace the STs with VGA cards.

No, you dips*it. You could use a cheap PC with such typically-cheap hardware. The point I was trying to make was that you are trying to pretend that $70,000 is required to access the web in "pretty color" and regardless of how you misinterpret and misunderstand what I am trying to say, you are WRONG.

> I bet these are
> the new Tseng Labs chipset VGA cards with an OS, web browser, and everything
> else you need in a single chip. Just hook up a keyboard and monitor, and go!
> You no longer need those minimum $1,200 PC boxes anymore, just the card!

That is really juvenille. You KNOW that I meant more than a card. You were just spouting off again, that's all. VERY stupid; VERY typical of you.

> Wow, James, your post has confirmed and sealed your reputation on the
> USENET for FUD (which, I understand, goes back to your equally-embarrasing
> stint at a Mega ST advocate!).
> Please, James, get a clue, get an argument, and credibility may yet find
> its way to your posts.

Here you go off again with your concerns of reputation. Obviously, you have no life and little to pride yourself on if you're trying to find it here in an advocacy newsgroup!!! HA HA HA!! I already said (in another post) that I don't care about that at all. Why would I? Furthermore, why would I look to you, my nemesis, for advice on credibility? Do you *really* think I believe your criticisms? Are you so stupid to think you can give me advice on credibility? Evidently so, for you have...HA HAHA!

As for your credibility: You're the one who said:

-that a $250,000 company and $10million company may be running the same systems.

-that NOBODY uses library media centers/resources

-that the SELLING POINT for TOS is that it's different and less-known

-that businesses COULDN'T CARE LESS about standards (then flip-flopped and said that they do if it's a matter of cost, as if cost sometimes doesn't matter...ha ha)

Good work! You're credible, alright....in a pig's eye.

Oh...and about that Mega-ST advocacy thing you think you're onto: What are you talking about? I'd really like to know what that's about. YOU MENTIONED IT. You must know what you're talking about then, right? So tell me; what is the conflict of interest you think you're upon? Come on....oh....you don't know? Didn't think so....

James

>$5000 for the entire collection such as ref. materials?

$5,000 for hardware and OS.

>> Your solution is?
>
>I would quit.

Yep, thought so. I hope you'll never be responsible for the computer equipment of a school that is low on money. You'd throw out all the existing equipment (esp. if it were STs) and leave an empty room as a result.

>>>So, if another school or district discarded their last ST's for school use

Wait a minute: Apple IIs are useful, but STs "do more harm than good"?

>There are a lot of
>software that works fine for the 68k Macs. The Statewide AEA centers supply
>schools with anything they need..

That's why I'd use any existant computer that meets some minimum standards
(e.g. 80 chars/line are preferrable) for my equipment if I were low on
money. Do you finally get the idea?

Thorsten

Your definition of obscure is most obviously measured by available help
in an office/computer store. So James, walk into OfficeMax and ask for
the latest upgrade to Solaris. Or tell them that you need an update to
the OS on your Bailey Controls system. See what they tell you.
---

>(convenient amnesia, no doubt) here's your quote: ["One selling point for
>TOS systems (especially among small businesses) is the fact that it is
>different and less known."]

It still stands. And you _STILL_ haven't even addressed the point about
reverse-engineering (the primary reason I believe this quote to be accurate).

Perhaps you cannot, simply because the point is valid. Systems that allow
throughput that cannot be reverse-engineered, equivalent to competing
systems, are inherently advantaged to those systems which can be reverse-engineered. This doesn't require vast intelligence to understand.

>> The utility that the average user realizes from Papyrus (effective
>> throughput) is the same as that from Word95 on a Pentium. However, the
>> Pentium requires more power due to the inherent inefficiencies of Win95.
>
>Once again, you rocket-scientist-wannabe.... Re-read the quote to which
>you were responding. I said "Do you have proof of this? Just because

Throughput = results, the final product, in a volume desired.
Can you tell the difference between a Papyrus printoout or a Word printout?
Is one printout "better" than the other? Nope. Throughput is equivalent.

>Rather, seems like you demonstrate YOUR lack of knowledge of business
>computing with that last sentence above. If businesses didn't care about
>standards then each business would have a totally proprietary
>computer....kind of like 20 years ago. I can't believe that although you

All businesses are not equivalent. Not all businesses have need for proprietary
systems. Others still do. By engaging yet again in the slippery slope
fallacy, you damn your entire argument.

>"Most businesses couldn't care less about standards." You think a small
>business can afford to hire a team of programmers to write their software
>when they can open a box of standard business software instead, and have
>no trouble finding employees who are already familiar with the software?

Most businesses couldn't care less about standards. In the example you
pose, th ebusiness must first ask itself whether utility justifies cost
in the acquisition of the computer system. They must then select the system
that costs the least to achieve the desired goal.

If I am a consultant for them, any machine they choose will be decently
supported. The support issue is primarily one of cost, not an initial
consideration, but only a part of one.

TOS machines have plenty of boxed software, so what's your point? As per
customized software, there are many software companies engaging in
production of customizable systems (ie. lean production). Perhaps you
should learn a little bit about that too.

Businesses don't start out with "standards" consideration. They start
with cost/benefit analysis. Those that start with "standards" as a primary
consideration find themselves frequently being dusted by the larger, more
fluid competition.

>bonehead? That's the whole point. With the mass-production that standards yield, economies of scale allow lower costs and thus lower prices. You know NOTHING of economics.

Economics? Which school of thought? Keynesian? Friedman/Chicago? Austrian? Classical? Socialist?

Re: mass production
Economies of scale were not the primary benefits of mass production. Interchangability was. This is why GM, Ford, and Chrysler prospered in the period before Japanese competition. However, the Japanese entered the market, wth a lean production effort which combined economies of scale with customization, and dusted the Big 3 for years to come. While GM made 1 million Caprices and then sold them, Honda receioved a million orders for Civics and made them to order.

You need to learn more about standardized business theory. I suggest you start by reading Eli Goldratt's "The Goal," a novel-like text that explains the benefits of continuous improvement (frequently incompatible with mass production). A perusal of "The Machine that Changed the World," another frequently-read text about lean versus mass production, will further educate you on the methodology of lean production. An understanding of these concepts will help you understand why mass-produced systems in a competitive economy rarely succeed, and why lean production ethics rule.

An understanding of lean production will give you an insight into why businesses and individuals buy computers - or anything else. Utility attained >= cost of aquisition.

How does Excel provide any greater utility than K-Spread? Or any other competent spreadsheet? Do you frequently do probability distributions using Solver? Or (more likely) accounting? If so, spreadsheets are interchangable.

No what if you create a presentation within powerpoint? How tiresome. Every competitor (and client) knows how you did it and what pictures you used. Use of APEX Media will stun them, and they won't know how you did it.

On a simplistic level, you're keeping your competitors guessing (which is always a good thing - a predictable competitor is a dead one.)

>business doesn't need a Sun. Quit trying to hide in the shadows of
>Sun...we were talking about TOS systems. Proprietary custom systems
>still thrive? Yeah, like TOS, Amiga, etc... He he he. I wasn't talking
>"high end" like Sun...you keep trying to associate TOS with Sun..(hee
>hee) and hide behind it. Good try.

What makes a Sun (or Amiga, or TOS) useful? The utility gained from it. The point is that Suns are "obscure" by your definintion, yet contribute greatly to business workings. So do TOS, Amiga, and others.

Tell you what, James. You propose a layout for an airport shuttle business' advertisement in a local magazine (full color). Tell me how your PC syste, will do a better job than a Sun, TOS, Amiga, Acorn. Be systematic and specific. You won't be able to do it, but that's another issue entirely with you, right?

The expenditure would require purchases of PCs as well as graphics cards,
T-1 line, etc. It would cost $70,000 in total, since the school has to
scrap the STs and replace them with PCs. You know, they don't have PCs,
remember? Logic? Facts?

>> the new Tseng Labs chipset VGA cards with an OS, web browser, and everything

>were just spouting off again, that's all. VERY stupid; VERY typical of you.

Yes, I did know you meant more than the card. But the new PCs would have to
be purchased. Trying to get rid of the $70,000 is impossible. It's a
hell of a lot more expensive to purchase new PC clones than upgrade the STs.
Period. My sarcasm illustrated how obtuse your graphics cost argument was.
$75 per system is a tiny percentage of the total replacement cost per system,
and is only a fraction of the total (realistic) number above.

What the hell are you talking about? I think my comment was pretty self-explanatory. Brian's trying too hard to be a hero here, which is obvious because he wants to fight everyone else's battles for them in the hopes of appearing as n almighty Atari demi-God. It has nothing to do with "correcting loyal Atarians" or "persecution complex."

Good grief. The entire point is that the Omnicrom allegedly gives you high resolution. Brian has vehemently declared that it works with the SC1224 monitor. Since "quite readable 80 column resolution" is available on a STOCK ST, then what's the Omnicrom doing? That IS what we're talking about - the Omnicrom with the SC1224 and I want to know how it gets all that resolution on the monitor that I've only seen do 640x200 or 640x400 INTERLACED when plugged into an Amiga.

>   A $35 VGA card will look about as nice as an ST: same colordepth.

Tell me another one. VGA has been around since 1987. I would think you'd be familiar with simple specifications like VGA. VGA is backward-compatible with EGA, which includes a 640x350 in 16 colors, which is far beyond the ST. VGA includes 320x200x256 colors (versus 320x200x16 colors for ST) and 640x480x16 colors (versus 640x200x4 colors) for the ST. There's also a 320x400 mode for VGA. Now, do you still say that a PC with a $35 VGA card has the same colordepth as an ST? I don't see how.

This happens all the time. Not only are the budgets blown, but the end result is _WORSE_ than when the project began. All because of this strange obsession with dumping useable equipment for new stuff to be able to "play with."

>money. Do you finally get the idea?

I think you already know the answer to this one.

>I'm not aware of ANY sound system upgrades available for my ST.

Um, we're talking about a Falcon vs. Mac SE/30 here. . .

>High Density floppy drives..? Only with hack and slash "upgrade kits".

An external high density drive goes for about $130. Not "hack and slash" to me. But just try installing a high-density drive in a 10-year old PC or Macintosh. In the former, cards with DIP sswitches and BIOS calls will be necessary. In the latter, professional upgrades are in order.

And while the 520 can run most new software coming out, the PC-XT can
run none of the new stuff, and the Mac, almost none.

>Video upgrades..? Except for the one cartridge port plug-in (which I've just
>heard about recently, have never seen, and have no idea where to purchase),
>any video upgrade is an expensive hack and slash installation.

Of course, Mac color is very cheap. And for the XT, you can run a GUI
on an eight bit card running at 4.77 MHz. Whooie!

>CPU upgrade..? Again, expensive hack and slash installation.

Ummmm. . can you even _BUY_ a CPU upgrade for a PC-XT? I know that the
AT ones require extensive desoldering in many cases, and rarely run
all of the software that a replacement 486 box would run. . .

>Oh.. and considering most of the available space inside the case is already
>taken up by the memory upgrade, where is all this hacked in hardware going
>to fit..?

That assumes you want/need all of that hardware on a TOS system. If so, it's
cheaper (and easier) to just buy a Falcon.

>On the software front, the XT and ST are in similar situations. Much of the
>current PC software requires Windows and 386 protected mode to run, so that
>leaves out the XT. ST software development however has virtually come to a
>halt too.

Gotta love that one. "ST software development has ground to a halt." I
guess all those software reviews in ST Format are a long-time hoax!

>"solutions" given for the ST (text-only browsers like Lynx, telnet, ftp, etc)
>are all available for it.

Except for the browser that 99% of all TOS machines use, the CAB graphical
browser. Development of CAB/STiK and Oasis II are both far more vibrant
than DOS TCP/Lynx development.

With the XT, you're stuck since no magazines cater to it, most newsgroup
users simply order you to upgrade when you ask for help.

>In other words, a 10 year old PC can certainly do at least as much as a
>10 year old ST, easier and more inexpensively.

I particularly enjoy DTP, graphical Web browsing, and WYSIWYG word processing
on my PC/XT. <sarcasm mode off>

I just want to stick my head in this argument for a little second to share
some info on that article in the SJ Mercury News.

The article was about how schools in more affluent areas of the city have
more up to date equipment than those in poorer neighborhoods. It seems that

this school with the STs is in one of the latter neighborhoods. The teacher wanted to connect to the web page where Net Day 96 was being held. (Of course, she could have used a VT100 emulator or WWW130 to do so...) But I don't think she had the information on how to do this.

It's quite odd since B&C Computervisions (a major Atari dealer in Santa Clara) is only a free local phone call away. However, I think I know why they didn't help the school. The people at B&C say that you can't use the Internet on the ST unless you have a Falcon! I found this out when a customer was chatting with the owner of how he and his friend were using WWW130 on their STs and Falcons to hook up to the WWW. Yet, the B&C owner still didn't believe his customers. The oddest thing is that the owner said that "It's very hard to connect to the Internet" when using a TEXT only!

So it seems like the school is stuck with an Internet illiterate Atari dealer telling them the wrong info. (B&C is pretty good with other stuff though...) I wonder why they didn't bother contacting an Atari user group. There are three in the SF Bay Area: BAAUG (Santa Clara),ABACUS (SF),SLCC (San Leandro). They're listed in Microtimes (a free mag). (Computer Currents sucks rocks.) I'm sure someone in those groups uses WWW130...

I noticed the picture in the article showing the lab was quite odd. It looks like the school was part of the CCC Microhost Systems service. This was a VAR that specialized in making educational software just for their systems. And they chose the Atari ST as their platform. The STs were in a pretty funky setup. It looks like the STs are all networked up, and instead of a mouse, there's some joystick-looking device hooked up to it. The monitor screen showed a CLI (!) instead of the GEM desktop. I wonder if the CCC people replace TOS with their own ROMs?

Anyone have any information on this CCC Microhost Systems setup?

A Useless Fact: At one point, Atari had 1% of the educational market because CCC was able to install 100,000 STs in schools using their own software.

Only thing is, most the new printers require mac or PC drivers(Windows) to get any use of the printer . Look at the current Inkjets, you need the new drivers to be able to access the full capability of the printer. Sure my epson Stylus color works fine on both my MegaSTE and my 2 pentium 166's , but you are stuck emulating a EpsonLQ2550 printer at a very low res and you will find similar limitations on newer modems, etc with voicemail and most of the newer SCSI drives give serious fits to TT's and megaSTE's due to their need to support parity etc..........

Whats so special about the ET4000 cards. The chipset these boards are based on are 4 year old chipsets. Very outdated. Slow as tar , for anything on a PC above a 386. Thats why noone uses them anymore. Only reason They used the chipset on the STupid ST boards is because NOONE makes a chipset anymore that will even drop down to 16 colors on the PC. Or at least makes drivers capable to do so. It an insult in 1996 to even consider sing anything less than 24 bit color or higher on any system. Why dick with 16 colors. my god my old TI994a had 16 colors 6 years before the fucking ST even came out.

Pagestream has an Epson Stylus driver. But, you are correct in that text
editors, for the most part, that do not have printer driver support from
their authors have trouble with the newer printers.

However, even though I help others set up their programs on their PC
machines, I am still waiting for a machine (monitor not included! funny!)
that I can afford (that means under $2000). The lose of meaningful
competition in OS's and main processors has really affected me (note that
I said "me" - pointless getting into a discussion about whether or not the
last statement is true for anyone "other" than ME.

Glen Zabriskie (glenzabr@xmission.com) wrote:

James Wood <jamesw@PEAK.ORG> writes:

>that? Don't you know that the Atari days are over? Hell, man, in 1986

Atari's days are over. And the best years of TOS sales are behind us. This does not mean that current users cannot continue to gain utility from their machines, or that the machines have nothing to offer the new user.

>one couldn't even blow hard (as you do) about the availability of TOS
>magazines. Now that the ST has long since disappeared from stores, you

Please define "blowhard." I suspect you don't know what one is, and are merely using the term since I applied it (quite aptly) to you.

>magazines. Now that the ST has long since disappeared from stores, you
>expect anyone to believe your denial? All I am trying to say is that

I'm not denying anything. Certainly, the support of TOS varies from region to region. However, you used your limited experience with TOS magazines availability to make a general blanket statement about all users' ability to obtain them.

If your general point is that PC hardware is easier to buy than PC hardware, that there's more documentation, and peripherals and software are easier to buy, fine, you're correct. However, there are simply areas in programming, usage, and utility where TOS machines make sense. Add into this continued production by a multitude of companies, OS development driven primarily by users (instead of Microsoft, Apple, or Amiga Tech), a growing developer base, and decent support by system resellers, and you have a great system, one that has allowed me to compete quite well with the competition.

One selling point for TOS systems (especially among small businesses) is the fact that it is different and less known. The $1 million dollar company competing with the $10 million company doesn't have the $250,000 MIS budget that the $10 million company does. Result? If they're running the same systems, the $1 million company is probably running behind. TOS and Mac both make excellent systems. Output from them is less "guessable,"](ie. potential clients don't say "they did that in Word 6.0 and did that presentation in PowerPoint using the business graphics package).

You see, James, you're trying to characterize me rather than stick to the

issues, and your characterizations are incorrect. You'll find me installing SBT-based NT accounting systems for $5 million companies along with BEST Business Management accounting systems for $150,000 companies. I choose the machine for the job.

In terms of the school district, I recommended continuing use of TOS systems to save costs. A newer system would have been easier, but utility would have been exceeded by cost. This argument was ignored (as my clients sometimes ignore my advice), however, you characterized me as advocating purchase of 1040STs for Internet access (untrue), and played fast and loose with my position on the entire post. When you could not longer bend the argument to suit your needs, you blathered on through insults, and suggested I am saddened by the profits of PC makers, among other ludicrous things.

If you refuse to see the utility of a multi-OS solution, I cannot make you see. However, don't come whining back to me later when output drops due to a system switch. I had a client who switched from Mac to Windows 95 (against my advice) try to blame me for the resultant drop in productivity and all of the problems associated with the system (despite the fact I didn't install them, and told them that Win95 is ineffective in a business climate). Looks like I should send your name to them for a job reference.

That assumes that the labor involved is worth less than the profit (not true for most people).

```
---
Of course, you missed the entire point about computers' resale (the original
subject).  I cannot say I am surprised by your dodging the subject.  Tell
us, James, why should a computer be purchased primarily for resale value?
Can you name me some "modern" computers that appreciate in value over usage
time, or that have been known to retain 50% of the purchase value of the
machine over 5 years?
---
Unless you're a hobbyist, a good mutual fund, or careful market investment
yourself will yield far higher returns than car restoration.  Computer
resale will porbably never yield returns (look at the death of used computer
outfits like Exsel, Inc. for evidence).
---
Try and make your original points hold water, James, or you're only going
to "win" by outscreaming everyone else (which, I guess, is your style
anyway).

Now all you have to do is hope it doesn't mysteriously misplace any of
your hardware.

Then, hope your old software doesn't break (msvc 1.5 is a prime example).

The ST can fully address it's entire physical memory space without
contortions. This is much better than having 8 Megs of physical memory
and having to deal with 3 overlapping DOS memory models.

>problem was taken care of, then how can the ST's 4Meg barrier be much
>less of a problem?

What the ST presumes to do, it can do within the 4 Meg limitation.

Stores are there to get your money. That is their primary point in existence. They will do what they can to further that goal, oftentimes at your expense. I've yet to be in a computer store where the staff wasn't incompetent or just plain LIED.
Variation may all be in one relative direction: down.

In the end: a salesman is a salesman.

No you're not. There are usenet (and probably fido) groups setup
to disseminate just that kind of information.

>Since you can't seem to understand the anecdote, here's your example.
>The toothpaste commercial had a web address of WWW.COLGATE.COM. I

And what drivers are located at colgate?

>want to see what's there. How do I get that information from ftp?
>Without web access, I'm handicapped to that information. You disagree?

You're definitely handicapped. However, the use of the term 'information'
for those particular data are dubious.

Some people see a particular impediment as a mortal thing. Others
do not. Some bits of information are more accessable than others.
Your original example was a glaring example of same.

I'm still curious who put's their drivers on the web only: firms to avoid.

Also, you come up with a not quite so vacuous webpage as a counter-example;
they aren't too hard too find.

An intriguing question. If she was managing a significant group of ST's
one would expect that she would have already been plugged into what
support exists for the machine. It's seems strange that any experienced
ST user would be unaware of, at the very least, Toad.

>the stimulus for the story to begin with???? If she had a PC or Mac,
>she'd have been online instead of having the story. AIN'T THAT SO?

Perhaps. If she were that ignorant of her own machines, she might
have problems with other platforms that one wouldn't normally expect.

Also, as alluded to in the deleted part of the article: someone with
better
general online knowledge could have easily steered her towards user
groups,
atari fido and usenet groups & BBS's in general, as well as SLIP
account
providers.

      Why should I? It's precisely this 'bend over and say AHHH' attitude of the
      computer buying consumer that causes much of the bloat and bugs.
      Much is tolerated with computers that would not fly in most other
industries.

>using 16K.  What you fail to mention is that computing resourcs have
>gotten much cheaper too.  Could you get 1 gig drives for $200 3 years
>ago?  Could you get a meg of RAM for $25?

        Another 'resin fire' and the relatively recent and short lasting price
drop in
        DRAM may evaporate again. It is fortunate that those prices dropped,
finally,
        as they are a practical necessity. Hopefully the bloat wont grow too
quickly and
        nullify recent gains.

MS-Word has made it to the point where it has it's own virii now.
Excell & Word both like to re-arrange your documents for you (without
prior approval or notification) MS products don't play well together.
They hog the system and hog the resource segments. Excell eats up
enough of user/gdi, by itself, to make the system unreliable.

Nope. Spending money on any computer is not an 'investment'.
...and even schools have budgets. However, they won't need to sink
any more money into that great black hole.

The need to do so is only brought about by your personal preferences.

Instead of doing without, and interim solution can be used (Apple II,
ST, Ameoba, 386).

>duck behind the school arguement to try and conveniently ignore this
>fact? If I spent several hundred adding RAM, hard drive, omnicrom, etc.

RAM and HD's should be quite migratable.

>and tried to sell it on the open market, I wouln't get DIRT for it. Are
>you going to 'fess up to at least this much fact, or ignore it, or deny it?

Your point is irrelevant. Resale price has no bearing on how well a given
device will perform a given function.

[deletia]
>above (boasting of your alleged expertise) is exactly what I was talking

>"any ST" then with a hard drive added, then with a Omnicrom added. Then
>you try to pretend like nobody in this world can use a PC without

If they want to use the much vaunted 'expandibility' of the PC, they
will have to deal with IRQ and baseaddress allocation problems.
Given the many possible configurations of a PC (configurability is a
double edged sword), such problems can get rather nasty and quite
beyond the capacity of most users (especially some of the more recent ones).

>tripping up on IRQ conflicts..... You've demonstrated genius....at least
Between IRQ2 passthru, the com1/com3 & com2/com4 sharing irq's, and
some software not recognizing some irq's, configuration can become
nontrivial. (not to mention insufficient documentation of the hardware.

New user? Why would a new user want to board a sunken ship? I would say that the most potential left in a TOS machine is to existing, experienced users of the platform. I would not recommend an obscure, proprietary computer to a new user or they'd soon be frustrated when all the software an accessories they saw cheap at COSTCO wouldn't work with their "new" computer. Elementary concept. No go ahead and pretend like you don't understand...or maybe you really don't...not surprising.

Blowhard: Brian-Rolland Miller (or whatever your name is).
You asked.

> ---
>
> >magazines. Now that the ST has long since disappeared from stores, you

> availability to make a general blanket statement about all users' ability
> to obtain them.

Oh, it "varies from region to region." That's as close as you can come to admitting that it has dried up in large part. My "limited experience" with TOS magazines is greatly overshadowed by my virtually UNlimited experience in not being able to find any. I can make a "blanket statement" that PC magazine is available on most newsstands and TOS magazines are not. If you have trouble with that, or the situation is unpalatable to you, it doesn't change the reality. Once again, you are citing an exception to the rule.

> ---
> If your general point is that PC hardware is easier to buy than PC hardware,
> that there's more documentation, and peripherals and software are easier to
> buy, fine, you're correct.

And if you're going to pretend like what you have just written above (the only truth I've seen from you yet) is not a boon for a new user (rather than going on frustrating, unsuccessful searches for TOS support), then you're every bit the fool you appear to be.

> However, there are simply areas in programming,

> usage, and utility where TOS machines make sense.

Sure, it's a great hobbiest machine for someone experienced with the platform.

> Add into this continued production by a multitude of companies, OS development driven primarily by users (instead of Microsoft, Apple, or Amiga Tech), a growing developer base,

Heh heh!!! A multitude of companies? A growing developing base? You try to make it sound rosy. It's been a continuing story of "jumping ship" ever since Atari discontinued computer production. Why would there be a growing developer base? To take care of all those new customers? Users are defecting to alternative platforms all the time. It's a shrinking user base. A shrinking user base means a growing developer base? Probably using your brand of [il]logic. The "continued production by a multitude of companies" is a joke; you must be talking about mainstream platforms which are truly supported by a real "multitude of companies."

> and decent support by system resellers, and you have a great system, one that has allowed me to compete quite well with the competition.

Ha ha ha! System resellers where? Do you mean "system reseller?" TOAD is a long way from most people. I'm sure there are a few Atari dealers left. But they've mostly dried up. Are you going to try to pretend like that isn't the case now?

Sure it's a good system to meet hobbiest needs.

> One selling point for TOS systems (especially among small businesses) is the fact that it is different and less known.

This statement just shows what a disillusioned fool you are. That's the WORST thing about TOS systems. It's so different and less-known that it's obscure. I see you value obscurity as a virtue in microcomputers. You bozo. Businesses want to get software, peripherals, supplies at places like Costco or OfficeMax.

> The $1 million dollar company competing with the $10 million company doesn't have the $250,000 MIS budget that the $10 million company does. Result? If they're running the same systems, the $1 million company is probably running behind.

Heh heh heh. Only in your little scrambled noggin wou ld a $250K company and a $10 million company "run the same system." Right....tell us another one one, Brian. You don't know what a $10mil company runs because no $10mil company would let your sorry ass through the door. Your "services" could be very nocuous to a successful company.

> TOS and
> Mac both make excellent systems. Output from them is less "guessable,"
>](ie. potential clients don't say "they did that in Word 6.0 and did that
> presentation in PowerPoint using the business graphics package).

Mac has nothing to do with TOS. Don't try and hide in the shadows of Mac. Mac is smaller than PC, but there's a big enough base of Mac users to make it a viable platform. Mac is a world ahead of Atari. Mac can be considered a mainstream platform.

> You see, James, you're trying to characterize me rather than stick to the
> issues, and your characterizations are incorrect.

I'm not trying to characterize you. I have. You're a fool. I base this on most of what you say. Only a fool like you would value OBSCURITY (ie where you said the best selling point of TOS is that it's different and less-known) in microcomputers. Only a fool like you would suggest that a $250K and $10mil firm "run the same system." Only a fool like you would recommend an obscure, proprietary platform for new users or businesses, handicapping those users with industry incompatibility and a dearth of software and supplies. You should learn another trade if that's the best you can do.

> You'll find me installing
> SBT-based NT accounting systems for $5 million companies along with
> BEST Business Management accounting systems for $150,000 companies. I
> choose the machine for the job.
> -

Talk is cheap, I don't want to read your alleged resume. You've already proven that you're a fool. [see above about your value of obscurity in small-business computing]

> When you could not longer bend the argument
> to suit your needs, you blathered on through insults, and suggested I am
> saddened by the profits of PC makers, among other ludicrous things.
>

Not as ludicrous as your value of obscurity as a micro's selling points.

> didn't install them, and told them that Win95 is ineffective in a business
> Looks like I should send your name to them for a job reference.

Send them anybody else's name. Anybody could do a better job than you.

On Thu, 25 Apr 1996, Brian-Roland Miller wrote:

> Of course, you missed the entire point about computers' resale (the original subject). I cannot say I am surprised by your dodging the subject. Tell us, James, why should a computer be purchased primarily for resale value? Can you name me some "modern" computers that appreciate in value over usage time, or that have been known to retain 50% of the purchase value of the machine over 5 years?

I see "Used Computer Stores" going up everywhere. True, they're small. What the hell, bozo..... Of course there's no profit to be made on buying NEW computers.   There's no profit to be made on NEW cars, either. Also, there's a difference in spending $1000 in PC hardware or pissing a grand into proprietary Atari hardware because there's at least a possibility of getting at least a good part of your money back with INDUSTRY STANDARD hardware. No doubt you'll try to sidestep this point as well. I didn't suggest that anyone would be reselling their used PC equipment at a profit, but at least you can find someone who wants it and will pay _something_ for it. Go ahead and pretend like that isn't the case now; you're fully expected to.

> Unless you're a hobbyist, a good mutual fund, or careful market investment yourself will yield far higher returns than car restoration. Computer resale will porbably never yield returns (look at the death of used computer outfits like Exsel, Inc. for evidence).

Probably. Depends on what kind of car restoration. If you know people at the bank who'll call you when a cheap REPO comes in, you can make $2500 with a touch-up brush, polisher, pinstripe, and carpet shampoo. It all varies. As far as used computer stores go, I still see small ones so there must be SOME money in them. However, they DO NOT deal in Atari equipment, just PC and Mac because those used systems are still worth something.

> Try and make your original points hold water, James, or you're only going
> to "win" by outscreaming everyone else (which, I guess, is your style
> anyway).

"Outscreaming?" Take it easy, son. It's only ASCII. Gee, isn't that ironic that you have trouble with my points? Your the one who won't admit that used Atari equipment (or any proprietary computer) is esentially worthless, and instead pretend like ALL used computer equipment is equally worthless. From deep within your denial, maybe it erroneously appears that way to you.

James

Get off it. What is draining the poor tax payers? If the tax payers properly
supported their local school district consistantly instead of playing catch up

through stop gap measures, the cost of appropriate funding would not be as high.

Do you advocate I accept materials that has been descarded long ago that is titled Rhodesia, West Germany, and Etheopia(sp) considering that the content is lacking accuracy. Is this your definition of cost/benefit analysis. No wonder our people can't compete today is because cost analysis people as such as yourself micro managed schools to the ground...

: Sounds pretty smart to me..!

Where am I paying $900 for a $79 video card? Watch your threads more closely! The video on my Falcon is perfectly OK without upgrading...

: >you'll sink before swim with the amount of money that M$ will get out of
: >you before too long...
: And do a whole lot more work than with an obsolete Atari system at the same
: time...
: Atari computers do have some strengths remaining, but you don't seem to know
: what they really are.

I don't think my Falcon is obsolete. I will bet that I can do the same work on my Falcon as you can on a PC - but faster!! You seem to be under the misconception that if someone owns a computer that they must be (only) working with it. I think you should broaden your horizons a little, and stop staring down Bill Gate's anal tract. Buy a C-LAB Falcon and get APEX media or the forthcoming Apex 3/APEX audio and have some FUN with your computing for a change.

I have just watched my employer renew their site license to M$. On the basis of what I have of observed (problems they have, the sheer physical COST of the license, and the complete LACK of support from the 'M$ accredited technical people' that sold us the system (Win95/Word7/Office95/Access95 for 100 users)) I would say that M$ are more than getting their (un)fair share of my employers money...

Oh, and BTW, find another newsgroup to bother...you're boring me to death here...

Chris W.

Just for the record...Computer DirecT out of Canada is selling the Panther video adaptor card for only $188.00...lets any ST use a PC video card and all inside the original casing...Lets any ST have 800 x 600 video in 256 colors... Seems to me that schoolteacher should be told about that product. <grin> Toad Computers is also supposed to be selling it soon...

Keep up the good work, advocating Atari's, Mr. Miller and I'll go right out and buy another one...! <silly grin>

>Or plug in one of the several memory expansion boards that bypass this
>"problem" (which was in the two original revisions of Atari's custom
>chip). The first only allowed expansion up to 1 meg, the second took it up
>to four.

Umm... no... sorry, but that's not how it was.

The VERY FIRST 520ST had 4 Meg capable MMU chips in them from day one.

I know, I have one.

It wasn't long before 520 owners started hacking more memory into their machines by piggybacking 256K chips on top of the 256K chips already on the motherboard to give a total of 1 Meg. From there it was an easy step to using 1 Meg chips to give a total of 4 Megs.

But...

If you tried to go ONE BYTE further, the MMU would generate a buss error and the ST would bomb.

Sometime MUCH later in the life of the ST, Atari started using MMU chips with the 1 Meg limitation in some of the lower level computers as a cost saving measure. These were only used for a very short time.

The STe and Mega STe can address the full 4 Megs.

Originally the Mega ST1, ST2 and ST4 all used the SAME motherboard, with only the necessary amount of memory installed. The extra holes for the unneeded memory were left empty and were soldered shut as part of the normal manufacturing process (it's called "wave soldering", and results in any open hole on the motherboard being filled with solder. This one time, it can't be laid to the Tramiels' greed.)

However, when it became a well known and easy upgrade to simply melt the solder out of the empty memory positions and install relatively inexpensive RAM chips (the only difference between a Mega ST4 and a Mega ST2 was the 2 Megs of RAM, and the difference in cost was WAY more than the cost of the RAM would justify), Atari all of a sudden redesigned the Mega 2ST motherboard to eliminate the holes and positions for the extra RAM, making it impossible to use the simple upgrade method.

>Or plug in...

Er.. no. You don't simply "plug in" a hardware mod to allow addressing more than 4 Megs of RAM on an ST other than a Mega STe. Certainly not like "plugging in" a SIMM on a PC.

There's a thread on comp.sys.atari.st about extending memory beyond 4 Megs right now. From messages posted there, there exist THREE solutions to getting more than 4 Megs on an ST, and all of them are VERY expensive.

The one "plug in" that allows going beyond 4 Megs is a VMEbuss card which only fits into a Mega STe, and certainly isn't cheap.

Very little in the ST world just "plugs in".

Unfair? It's a free country and an open market. There are competing applications (Lotus, WordPerfect) and of course Macintosh (competing platform). Nobody put a gun to your employer's head, so it is his/her own fault.

>   So, what specifically, has OLE done for you lately?

OLE is great when preparing a document with graphics and text. I print out my lab reports with graphs, charts, and illustrations on a color inkjet and the results are phenomenal. OLE makes it easy. I can't excuse the "bloat" of Windows, and I don't intend to. However, I do maintain that it does more than the ST OS. Of course it should; it's a decade-plus newer. I'm not suggesting that Windows is God or anything; just that (bloat aside) it does have a lot more bells & whistles. A lot of the bloat is because Windows has to try to be all things to all people - to run all the f___ed-up DOS software in its own environment as well as the new Windows apps. Windows thus has more of a burden to carry than a platform that started out with a GUI on a "clean slate."

>
> It is called GEM (& TOS) btw, in case you were unware.

"TOS" makes me think of "Tramiel Operating System" and "Tramiel" makes me think of being screwed repeatedly by my [then] favorite company....
If I say GEM I could be talking about another platform's GEM. So I said "ST OS." If I say "TOS" though, I don't know if it truly includes the GEM parts or if it's just "CPM/68K" or whatever the underlying "DOS" is.

>
>   The added expense of the case and power supply of an external modem is

> less than the added expense of a MIDI adaptor for a sound card.
>
> That amount may seem significant too you.

There are a lot more internal modems in DOS boxes than MIDI keyboards hanging off the side, so it generally isn't a problem. Seeing how you have to buy an expensive MIDI synth (or other device) anyway, the added expense of a MIDI adapter is very little by comparison. You make it sound like some elaborate hardware is required. It's just a cable! Any generic Taiwanese part will do fine. Cheap modems are cheap modems and a cable Y-splitter purchase for MIDI doesn't lessen the value of a cheap modem. I hate having the external cables, power supply, and on/off switch of external. I always connect at HS so I don't need that light. My modem's on when my computer's on so I don't need that light. It's rather obvious by watching the screen what's going on. Back in the days of 300 baud I used to look at the SD and RD lights but now the bits go by so fast those lights do no good. Many users prefer the reduced bulk and reduced hassle of internal.....oh yeah, did I say they're cheaper?

>
> You can surf the web with a wyse60...

I've used WYSE terminals before but I don't remember the number. THey were all green or amber text-only. A wyse60 must be something better (a graphics terminal) if the web can be surfed with it. You're not going to tell me I can surf the web with a VT100 (or VT52), are you?

> >What's your point? There does exist old versions of PC sofware too. Just
>
> So what PC program contemporary to Pagestream has it's functionality
> and interface?

I don't know. I would imagine Aldus Pagemaker. I don't want to quibble over functionality and interface. Interface could be a matter of preference, so its not worthy of discussion. However, someone skilled in Pagemaker is more valuable if job hunting in that kind of work. Seeing how the wheels of industry keep turning with Pagestream playing a nil part, it must not be that revolutionary or the desktop publishing industry would have been turned upside-down. They're too busy using what they have - what's standard - and evidently what works (functionality). I'm sure Pagestream is a fine program nonetheless.

James,
Glad to see that you have again resorted to name calling.  Funny how it
always come to you calling other people names.  Why does a differing
opinion make a person a "fool?"  Why do you take these things serious
enough to resort to personal attacks?  Is it because you wish you still
had your ST?  I remember the days when you were espousing the Mega ST
as being a great machine and that it was much easier to use than
a PC.
Now will you call me a name again?  I don't agree with you so you should
start flipping through your book of insults.

> hi-color picture on screen at once is worth $70,000. I'd say no.

This is a typically assinine embellishment from you, Brian-Rolland. You're asking "the $70,000 question" in the end there and we don't even know what the hell quantity of computers we're talking about! Maybe all they need is 10 PCs; maybe they need three. We're not talking about getting them a P6/200mHz. HP donates PC hardware and printers to the U here, and also sells at a discount. PCs are cheap even at full-price if you bargain hunt.

There used to be a time when Atari was known for great graphics. Even when the ST came out (even though Amiga graphics whipped its ass) it was known for great graphics. Atari users wanted/received good graphics capabilities for the day. Now that the tables have turned and PC/Mac are doing truecolor, it's another case of SOUR GRAPES from people like you who reduce the virtues of good graphics to "looking at pretty pictures" and in your ridiculous embellishment, "paying $70,000" for them - a meaningless figure you pulled out of your ass.

You should try really hard to back off and take a wider perspective and see how many times the "sour grapes" scenario comes into play as far as your arguements go. It's a rather unsophisticated phenomenon, and even a vacuous imbecile could become self-aware enough to see when it's happening - but you persist. Could it be that your bull-headed arrogance (the most salient of your virtues) beguiles your common sense down to the last infantile modicum when you get in a pissing contest, or were you born devoid of all common sense? You unequivocally suffer from one case or the other.

No logic, no facts, no surprise.

>Oh, it "varies from region to region." That's as close as you can come
>to admitting that it has dried up in large part. My "limited experience"

Nice rhetoric. Let's see some compelling evidence, please.

>with TOS magazines is greatly overshadowed by my virtually UNlimited
>experience in not being able to find any. I can make a "blanket

It's still limited, so making blanket statements about general availability
based on that limited experience is enagement in the slippery-slope fallacy.

>And if you're going to pretend like what you have just written above (the
>only truth I've seen from you yet) is not a boon for a new user (rather
>than going on frustrating, unsuccessful searches for TOS support), then
>you're every bit the fool you appear to be.

1) I have not argued that the above isn't a boon to the new user. You are
inferring that I did.
-
2) Engagement in such an argument is known as the "red herring" fallacy, in
which the opponent, with no factual argument, attempts to make it appear as
though his opponent is arguing an obviously irrational point, in order to
unethically gain an advantage.
-

3) I fully consider these to be advantages. I also don't consider them to be enough of an advantage to _all_ new users to justify purchase of a PC. If any new user was to consider only PC's, his decision would be skewed. You, James, are not the king of new user logic. New users should evaluate all systems based on their needs, desires, and expectations, and purchase the one that meets them.

-

The PC is available everywhere, but has an inability to run new software after about four years, requiring constant replacement. The TOS machine has a longer useful lifespan, but "help" isn't available in every corner of the world a block away. The user has to decide what he wants, and how much he is willing to pay (in time, money, and frustration) to make the choice. By attempting to make the choice for him, you engaging in paternalistic arrogance.

>Sure, it's a great hobbiest machine for someone experienced with the
>platform.

Or even someone inexperienced with the platform. For example, consider an idividual with a decent knowledge of BASIC, wanting to move up to C. HiSoft C Interpreter is a wonderful tool for learning C. When he is ready to progress, he can continue with Lattice or Prospero or any number of compiled C languages, and integrate cross-platform compatibility along with learning without paying high prices. This is but one example.

>Heh heh!!! A multitude of companies? A growing developing base? You

OK, James, there are no companies that develop TOS software, the number of shareware developers is shrinking. In fact, no new software has been released for TOS since 1986. Right?

>try to make it sound rosy. It's been a continuing story of "jumping
>ship" ever since Atari discontinued computer production. Why would there

Atari's discontinuation did not affect supply since C-LAB and others took over production and development.

>ship" ever since Atari discontinued computer production. Why would there
>be a growing developer base? To take care of all those new customers?

Developers aren't just commercial - they also program freeware and shareware. And application development overall (in commercial and shareware markets) has markedly INCREASED over the last year and a half (a perusal of ftp.atari.archive.umich.edu will prove this).

>shrinking user base. A shrinking user base means a growing developer
>base? Probably using your brand of [il]logic. The "continued production

Ignoring yet another fallacious personal attack, most of the userbase that was going to leave left during 1991-1993 (at least in N. America). Now, new users are being attracted by the open OS development (a point you don't address, interestingly enough).

>base? Probably using your brand of [il]logic. The "continued production
>by a multitude of companies" is a joke; you must be talking about
>mainstream platforms which are truly supported by a real "multitude of
>companies."

The C-LAB Falcon, Medusa, Hades, Eagle, and other TOS clones are all produced by various companies. Apparently you don't know too much about anything other than 520STs and Atari Corp.

>Ha ha ha! System resellers where? Do you mean "system reseller?" TOAD

I can call STeve's (or Toad, or a number of other mail order companies) and get a knowledgable person to answer my call for the cost of long distance (ie. no 900-numbers). If you want to attack users who purchase PC's and service/add-ons through the mail, consider the fact that according to Dataquest, 30% of computer sales were via mail last year. The biggest PC clone makers all operate by mail, and usually offer far worse technical support for the systems they sell than the TOS resellers in the US.
The point remains valid.

>This statement just shows what a disillusioned fool you are. That's the

Tell that to Yankee Graphics here in Massachusetts, which recently used APEX Media to dazzle attendees at the Internet Conference held in the Prudential Center in Boston recently. Noone knew how it was done, and everyone was pleased. It also was the lowest-cost multimedia option available to them, and they were able to produce these results with just one Falcon and two people, not a dozen Suns and a team of twenty. I am most assuredly skilled to speak in this area (it's where I make my money). Again, your personal attack was without merit, and once again reinforced the "blowhard" element of your personality. (You may want to check the dictionary and find out just what "blowhard" means.)

>WORST thing about TOS systems. It's so different and less-known that
>it's obscure. I see you value obscurity as a virtue in microcomputers.

So when competitors reverse-engineer your presentations or techniques, they cannot do it. This is of untold value, especially in small business.

>You bozo. Businesses want to get software, peripherals, supplies at
>places like Costco or OfficeMax.

:') I can see that you have no grounding in reality.

Most businessess don't buy software themselvges - they have an MIS
dpepartment that buys it, or they have consultants who recommend systems.
This way, they use a system in their price range that real support is
readily available for.

Office Max (and Staples, etc.) primarily sell disks, printers, and cases.
All things that are universal.

Of course, no business want's SUN Workstations, either. They don't even
have a floppy drive, and you cannot buy ANY Sun peripherals at Staples.
No local dealers exist, software support is tiny even compared to TOS,
and most purchases have to be made through mail order.
What a horrible system.

Jeez, James, I think it's time for you to stop flipping burgers at McDonalds
and start your own business. If you survive in a competitive marketplace,
I'll be amazed. You're insistence on blindly adhering to a single standard
rather than exploring all options doesn't work in the free market, or in
any market with a modicum of competition.

Atari store, everyone throughout the US will be able to get a
local ST for cheap. Noone will be able to get a used PC, bozo.
JW brain emulator off.

>buying NEW computers.   There's no profit to be made on NEW cars,
>either. Also, there's a difference in spending $1000 in PC hardware or

Oh, really? Add $150 over invoice and the 2.5 - 4% paybacks by automakers
to dealers at the end of the year, and we get a gross margin of 3.5 to
5.5 percent - not bad in a market that has essentially evolved into a
commodity industry (interestingly enough, higher than the average margin
on a PC clone).

>a possibility of getting at least a good part of your money back with
>INDUSTRY STANDARD hardware. No doubt you'll try to sidestep this point

Apple II hardware was "industry standard in education" 5 years ago when
it was still popular. What can a school get for a circa-1990 Apple II?
A circa-1992 PC clone? There is no resale value, this argument is complete
nonsense.
You have yet to give a concrete example.

>equipment at a profit, but at least you can find someone who wants it and
>will pay _something_ for it. Go ahead and pretend like that isn't the case

Anyone can find someone who will pay "something" for a computer. The
question is : How much? The answer is: Not enough to worry about by the
time you're ready to scrap the computers. The consideration isn't a
"mainstream" consideration.

>there must be SOME money in them. However, they DO NOT deal in Atari
>equipment, just PC and Mac because those used systems are still worth
>something.

So what will a 486DX2-100 sell for in 2001 (in 5 years)? What is the
purchase price now?

Souped-up STs command decent prices on comp.sys.atari.misc. There is a
marketplace, one just hs to find it.

Stooping to this argument is really scraping the depths of desperation.
Most business purchase computer hardware and amortize it over a period of
four years (some even do it in two). Any money gained from resale is seen
as a lucky strike, not as an expected return. Why should schools expect
anything different?

Of course, this thread isn't relevant to the discussion, but that's what
red herrings are for - diversion from the task at hand.

>asking "the $70,000 question" in the end there and we don't even know

I outlined it multiple times. . . too bad you were busy things thinking "Tramiel Operating System" Atari. . . . AGHHHGHGHGH! instead of reading my argument. The $70,000 number quoted numerous times throughout this and related threads was for 25 net capable PCs and included all of the amenities that you and BobR claimed were necessary (full-motion video, etc.). It does not include the $7000 to $10,000 monthly for a T-1 leased line for Internet access at speeds conducive to what you were advocating. Use of a SLIP line would deliver no better results on a PC than on an 1040ST.

>need is 10 PCs; maybe they need three. We're not talking about getting

Okay, for 10PCs, we have $28,000 in expenses. For three, we have $8,400. I am not including the growth in price from such purchases as volume decreases. I assume that since she has a "classroom full," 25 is a conservative estimate.

>meaningless figure you pulled out of your ass.

Ignorance is bliss, isn't it?

The number is full documented, and cited for all to see. Perhaps what you need to do is actually read the messages you are responding to, rather than engage in a typical blowhard rant.

OK, I set a limit for you: 5,000 US$.

The classroom is equipped with stock STs.

Create as many workplaces for Internet access as possible, using money
given.

Your solution is?

>A new collection
>in the media center had to be developed from scratch. I had to decide if I
>would except discarted out dated materials from other schools/district to fill
>up the shelves. I decided not to except discarded materials using to rationize

I.e. an ST work processor or spreadsheet, a programming language or
database will not teach them anything. What pupils really need is Windows
95, Netscape, Excel, Word and Access on a 133 MHz Pentium.

>Other means like cheap
>refurbished Macs that can be aquired like the LC/Performa 570 line and other
>040 Macs can be had for little money.

As opposed to "no money" for the STs already there.

>Still can run the latest education and
>internet software and so on..

How much longer? Remember that the Mac is also sinking into oblivion, and
moreso the 0x0 models. And forget the silly impression that Netcrap runs
on a Fat Mac or SE/030.

OK, so put a P100 + fan into a palmtop and see how far it gets. For a medium-dissipation device, cooling means a little more design than fitting a fan and hoping for the best. Remember the marketting scam which resulted in so many people buying new cases, special cooling mechanisms etc etc?

Rumour has it (but I don't like to play on rumour) that Nintendo's new device for the GameBoy is a SSA-110. There'd be a lot of kiddies with burned fingers if it was a P5/P6 ;-)

> This strongarm cpu wont eclips even a bit the x86 market (AMD, CYRIX,
> INTEL) because the x86 feed on MS users...

I was actually (obliquely!) referring to Intel's foray into the STB market, with their cut-down 486SX - it seems this is fairly underpowered, but they're stuck without a hope of using a P5/P6 type core, because no-one's likely to tolerate forced cooling in their living room. Anyone for a petlier-effect heat pump?

> Software is the key to a CPU, sad but true.

;-) I generally detest most of what is M$, but isn't WinNT multi-platform?

> but hey, if the Strongarm is that good and can run a x86 emulation at
> Pentium speed they could build some even cheaper multi OS clone with
> it...

"allegedly" It's going into a PPCP based machine that ART are developing. (note that this isn't the machine that the SSA-110 has been demonstated in) Given the likely price of these things, cost of packaging etc etc there's no reason why a SSA-110 PPCP card should be very expensive.

> I think strongarm is more of a threat to the PPC then x86

I think strongarm will, like the Arm, create its own new market areas. It's the size of these market areas which will determine the success of the product and its competitors.

Stuart.

The case study budget limit was $50,000. My ending conclusion was that it is
not enough to start a media center from scratch. Thats what my prof looked
for. I analyzed the situation and concluded correctly.
>
> The classroom is equipped with stock STs.

Why not C-64's? TI 99/4a? I can get used LC's with harddrives for $97 from
ComputerTown in Massachusettes and New Hampshire. I still would not buy those
LC's, IICI 8/160 for $297.. I would buy used PowerMac Performas for $1000.

Apple II's are still useful with all that software.  There are a lot of
software that works fine for the 68k Macs.  The Statewide AEA centers supply
schools with anything they need..

>address 8 megs?

None at all. Windows NT is very stable, it's the OS I install most for clients. OS/2 has even been giving way to NT as of late, especially for Web server applications. However, for small business or the average user, the cost of NT is _STEEP_. IF Microsoft bundled NT with other manufacturers' computers rather than 95, things would be a lot smoother for the average user. Unfortunately, Microsoft believes stability and reliability are things that the user should have to pay a premium for.

Groovy conclusion. I assume that you have not omitted any relevent
information? If not then it is reasonable to assume we do not know
why the equipment was discarded. The reason could be simple - their
budget could be larger than ours in which case we would be missing out
on an ideal opportunity to pick up equipment at cheap rates.

>So, if another school or district discarded their last ST's for school
>use inorder to get upto date with Mac/PC, would I aquire those ST's?
>Probably not, because it would do more harm than good. The ST is a
>outdated resource material. Even if you can get cheap ST's at flea
>markets, its a bad idea to add as a resorce tool to the media center.
>Other means like cheap refurbished Macs that can be aquired like the
>LC/Performa 570 line and other 040 Macs can be had for little money.
>Still can run the latest education and internet software and so on..

The ST is not an outdated resource material. "Outdated" implies it was
at one time not so - this is clearly not the case. The ST's internet
potential has never been at the leading edge and never will be. The
essential point is that a ten year old machine can do very nearly as
much as a top of the range PC or Mac can do - albeit not as fast or as
pretty. It can certainly do far more than a ten year PC could ever
have done or be made to do, and easily held its own against a ten year
old Mac.

>Even 486 clones can be had for next to nothing and have more utility
>than the ST. Much more adequate to run educational resorce apps as
>well as the latest internet apps.

No denials from me on that score. To put it in context though, will
you still be able to make satisfactory use of your current machine ten
years from now?

First of all, Thorsten, you've fallen into his trap. _NO_ graphics
card for an ST costs $800. The most expensive I've seen for the single
box units is around $400 (or 50% of his inflated, fabricated figure).

>>What resolution does the browser run in? 320x200 in 16

It runs in all of the above resolutions, plus any others you're capable of
running.
-
It looks prettier in hi-color on my Falcon, but runs fine in mono or medium
res. And the pretty looks don't justify the $70,000 expenditure necessary.

Let's view this paradigm in an appropriate light.
-
1) Define obsolete.

-
2) Define how utility is affected by obsolecence.
-
3) Tell me how a vastly-superior Falcon030 in any way, shape, or form, can be compared with a Mac SE/30 on any basis other than that of CPU.
-
Until you do this, your argument is a vacuous expanse of hot air.

>Unfair? It's a free country and an open market. There are competing
>applications (Lotus, WordPerfect) and of course Macintosh (competing
>platform). Nobody put a gun to your employer's head, so it is his/her
>own fault.

Yes, but all of those are "inappropriate" for business, right, James?
You've just validated the entire multiplatform argument from my perspective.
Many businesses I work with on a weekly basis CHOOSE TOS over other OSes
because of its ease of use and low cost of operation. MS applications aren't
good for everyone. Neither are Intel systems. Or Suns. Or TOS machines.
Or Amigas.

When people are permitted to find their own solutions, without a James Woods
blowing hard about "adherence to standards," and other such manipulative
garbage, the world shall be a much less unpleasant place to do business.

I pick up the challenge.

For the completely computer illiterate computer teacher (an ironic contrast that frequently can be observed):
(I'm assuming we have 25 ST's).
-
1) Buy 25 modems for $100 each - $2,500 spent.
-
2) Buy 25 copies of STalker for $20 each - $500 spent.
-
3) Purchase 25 shell account from an ISP for $50 per year (volume discount frequently encountered) - $1,250.

WOW! We're still within budget. And if the teacher even wishes to invest the effort, CAB/STiK could be used on this system.

We're now on the Internet, not with state of the art equipment, but we've achieved far more here than we could have by putting the $5K toward all-new equipment.

Hehe - I'm quite aware that there are P5 notebooks. Perhaps irony went
awol.

So what's the dissipation of these things (presumably @3V, or are they
onto differential logic?), and where's the palmtops? How much do they
/really/ cost in quantity? I thought the Mips/watt thing had been
laid to rest a long time ago.

Whoever puts a decent amount of Intel processing power in something the
size of a Psion 3 will be a very rich person indeed!

Stuart.

Profligate spending with no substantive return. "Media center" is a catch-phrase for libraries with lots of expensive equipment that nobody uses. I've seen schools spend over $100,000 for such stuff as laser disc players and CD-ROM access units. They are lucky if they get turned on twice per year.

>Buy an overpriced, underpowered C-LAB Falcon..?

"Overpriced: a state in which price demanded is greater than utility gained." In other words, the purchase of all-new computers when STs presently installed would be sufficient for access.

-

In addition, those "underpowered, overpriced" systems are used by individuals and businesses every day to keep a competitive edge. Power is defined by utility and results, not a bunch of CPU speed figures. Effective throughput of a TOS system running at 20 MHz is equal to Pentium 100 systems running Windows 95. All the extra power is consumed by the OS on the Intel system. Whether or not that's good is irrelevant. The issue is that, for any application

you put a Falcon030 up to, (be it C-LAB or Atari), it effectively competes with Pentium systems due to its lower resource requirements and more elegant architecture.

James Wood <jamesw@PEAK.ORG> writes:

>Funnier how you only see one side of the situation.

Seems to me that only one side engages in insults - usually when his argument is bursting into flames and plunging toward the ocean.

>If they're making arguements laced with lies and mistuths, and call me a
>fool when I try to correct them, I'd say they meet the qualifications.

Mistruths like "utility should meet the additional expense." Mistruths like

"STs can boost graphics resolution for $400." Mistruths like "BEST Business
works is adaquate for small business." Mistruths like "The Falcon is viable
for small business."
-
Doesn't seem to be too many mistruths there. You may disagree, but your
engagement in obscene/vulgar insults is demonstrative of your general
lack/failure of mental capabilities. Your psychological-emotional
connection between TOS and Sam Tramiel is but one example of this.
---

>> I remember the days when you were espousing the Mega ST
>> as being a great machine and that it was much easier to use than
>> a PC.
>
>As if that's contradictory to where I stand now? What's your point?
>Where did I say otherwise? Oh boy I can't wait to see this.....BWA HA HA!!

This is demonstrative of your "mine is better" ethic. Whatever machine you
happen to think is best at a particular time is the only machine that makes
sense for anyone at a given time, and all others are useless, etc.
---

>> Now will you call me a name again?
>
>Only if you ask me NICELY. YOU HAVE TO ASK NICELY.

What arrogant pap.
---

>> I don't agree with you so you should
>> start flipping through your book of insults.
>
>No, you don't agree with me. You wouldn't be wrong but you didn't (try
>to figure that one out!)

My predicition: if Mr. Tirrell (sp?) engages in an argument with you that
lasts for a while, after six posts, you will engage in multiple insults
when your psychological-emotive connection between TOS and Tramiel cannot
be justified by the facts.
-
Really, James, let it rest. Until you can describe specific applications
that the PC does and doesn't excel in, what replacements are available, and
how much they cost, you will be continuing the blowing of noxious hot air
that has given you such a poor reputation on the c.atari newsgroups.

Some of us have been on the Net longer than either Winsock or Netrape.

Pluging in a modem is all that is required.

Even on a lowly ST (although at the time not so lowly).

>of print; it would have been "mission accomplished" rather than despair
>in the limelight.

Were the media technically literate, she might have been steered to BBS's
or shell ISP's before the article ever made it to print.

TCP/IP and X.64 are hardware independent.

Platform specific knowledge is really not required.

         Actually, the 640K barrier has to do with how much memory the 8088 was
        capable of addressing. Microsoft chose to capture this limitation, as well
        as other aspects of the 8088,  within it's OS for all time.

         Both the XT and ST would have been served better by putting I/O space
         low in memory.

Equipment that uses standard ports are usable across computer hardware
platforms. ST's have some of these ports. Therefore, you can get new
hardware
for your ST at CompUSA, Computer City, MicroCenter, Incredible Universe...

Imagine that. They're supporting the Atari computer line and not even
knowing it...

However, the ST line can be used for more than just 'educational programs'.
Also, if I were to make a recommendation for an 'educational platform'. It would
most likely NOT be the ST. Also, the ST is quite capable of doing other things
besides 'educational programs' and 'music'.

Also, buying new machines might not even be an option. For some it is not.
Had it been, the article in question would likely have never been necessary.

The recommendation: "Dump your current platform", is rarely a viable one.

A Volksfarben 4000 board costs 460,- DM including driver software, AFAIR.

>We never did establish the current price of a graphics upgrade to a 1040STfm,
>which is probably the system the teacher in California is dealing with.
>
>The best we got was from Thorsten, which was approximately $900US.

Nope, there are cheaper ways, but nonetheless equipping an otherwise stock
ST with a graphics board is a waste of money, for a used TT or MegaSTE
with board or even a Falcon030 have a greater value for the money.
That's why I advised using text only browsing, either with CAB or lynx or
via VT100.

>Next... will all the manufacturers of the software she has send her updates
>to the programs to take advantage of the new card..?

Again, Bob: GEM and TOS software runs on any graphics card. It's just
dirty hacks that don't. No need to buy new software.

newsgroups: comp.sys.atari.advocacy

Get a Life is an interesting thread to observe. The argument in whether the ST is appropriate in the classroom/media center reminds me of pass class discusion in my Masters program of school media study..

A case study was upon us where we had to develop a plan for a new media center from scratch. A budget had to be proposed with a set limit. A new collection in the media center had to be developed from scratch. I had to decide if I would except discarted out dated materials from other schools/district to fill up the shelves. I decided not to except discarded materials using to rationize if its not good for their students than its not appropriate for mine even if the media center collection will be somewhat bare for the first year.

So, if another school or district discarded their last ST's for school use inorder to get upto date with Mac/PC, would I aquire those ST's? Probably not, because it would do more harm than good. The ST is a outdated resource material. Even if you can get cheap ST's at flea markets, its a bad idea to add as a resorce tool to the media center. Other means like cheap refurbished Macs that can be aquired like the LC/Performa 570 line and other 040 Macs can be had for little money. Still can run the latest education and internet software and so on..

Even 486 clones can be had for next to nothing and have more utility than the ST. Much more adequate to run educational resource apps as well as the latest internet apps.

```

BobR, Don't draw my name in your spat with Jedi...He is not my little brother. My little brother is Matthew and his e-mail is Msinclai@Hawaii.edu .....->

The problem with you ST'ers is that you can dish it out but you can't take it when it comes back to you all.

I remember when ST and Amiga users went off on thier tantrums towards Mac/PC users in the 80's. I was an Amiga user/owner until 92 but defected when the Mac became cheap and had fantastic apps that the Amiga and ST lacked. I never flamed Mac/PC users for their choice.. I decided to state facts about the Amiga and ST in a experiment to see if they could take their own medicine. Well, I proved they could not.. It's nice to dish out but when the other foot drops such as the Tramiels handling of the ST into the ground, all you fanatics held the belief that the ST is superior despite the other platforms advancing beyond the capabilities of the Amiga/ST..

Hang there, dude. I wasn't _really_ calling "anyone" who has difficulty with a PC "stupid." I was pointing out that if these self-proclaimed, alleged "Atari experts" are indeed so knowledgeable about computers as they purport to be in their postings, they shouldn't find it so difficult to install a VGA card. If someone is so adept with computers that they are an "expert" and they can't install an internal modem or VGA card in a PC (provided they had instructions, like all new VGA cards come with), then they must indeed be stupid. That's not "everybody." As a matter of fact, PCI is very popular today and has pretty much become the standard since the Pentium push got underway. PCI is "plug&play." Even the new

Macs are using PCI. What's so hard? Maybe they're the type who needs a video to watch first....hardware sold under the mass-market package name "Reveal" comes with a VHS cassette and a 1-800 number for people like these "Atari experts," should they ever sprout pubic hair and attempt a major technical undertaking like installing a VGA card in a PC.

> I know a person
> who is getting a 4.0 in her third year in Physics and her PC always
> gives her headaches.

I'm sure if you look hard enough, you can find someone with a 4.0 who can't tell his a**hole from a hole in the ground; in either case it doesn't necessarily mean the task is difficult.

> Besides, we were comparing the difficulties
> of use for a teacher wanting to connect to the Web.

True. Then the "experts" asked everyone to bow down and agree that installing an ISA card is far beyond the capabilities of the general population, and I replied and you replied and here we are. Such a cute little play-by-play, eh?

> Both systems
> have advantages as far as ease-of-use.

I'd say their both easy to use. I'd have to say that my ST was easier to use, but using a PC still hasn't been difficult for me. There's always a learning curve that you're constantly moving up and switching to PC moved me back down the curve as far as my relations with my personal computer, but of course it's not difficult to use a PC or they wouldn't be so popular. They're just not "the easiest in the world." Macintosh is. But we weren't talking about Mac. Also, I didn't do all the things with the ST that I do with Windoze (OLE, DDE, PCMCIA, etc.) so of course it was easier.

> I have heard quite a few horror
> stories about Windows 95, btw, in PC magazines.

You'll see horror stories about anything under the sun. Does that mean you believe them all? All it takes to generate a horror story is a petulant, emotional, highly-opinionated malcontent like these "experts" I'm arguing with.

> Furthermore, I have
> a friend running Netscape 2.0 under Win 95 and he thinks it is
> very unstable.

Since Windows 3.1 came out, my PCs have been the most stable computers I've used. I had occasional crashes with 3.0, just as I got bombs on my ST - which wasn't much of the time. I'm sure a Macintosh may be _more_ stable, but my Windows PCs have been very stable still. Nothing is idiot proof. People's experiences may vary. However, it's not as bad as the malcontents like to cry about.

summary: How to drive Cubase on 2 Falcons?
```

A friend of mine wants to drive the Harddisc Recording program Cubase Audio 16 on 2 Falcons. There is only one problem: He doesn't want to buy 2 full licenses .... Steinberg, the software firm, doesn't offer any solution cheaper than this. To copy the whole crap doesn't work (apart from it would be illegal) for the program demands a ROM key. Is there any idea in the universe how to deal with that without to waste 1000$?

A friend of mine (same as in the previous news) has a Falcon and a VGA Monitor and a special cupboard, where both are installed.

There is too less space to connect the computer with the monitor with a cable AND an adapter. So he has the question: Is there any vendor of falcon stuff who may sell cables to connect VGA and Falcon directly?

Central to this arguement is the fact that you have been telling us that WWW130 (or whatever) will allow me to access the web with ***ANY ST*** and that is why (if you'll put your insolence on hold for just a second) I mentioned the ST's graphics resolutions. So to correct you, the relevance of my question is unquestionable; what other resolution is a standard ST going to run it in? I have no doubt with $800 investment in a $50 520ST I could have imatation VGA. However, I can get a second hand 386 system for waaaay less than that and still sell it in the classified ads when I upgrade. I buy PCs and parts in the paper all the time and upgrade for very little because I can sell the old stuff; there's a market. Good luck trying to get anything for a $50 ST plus $400 graphics box plus $200-$400 monitor. Hell, I've bought and sold stuff on the campus bulletin board. Good luck trying to do that with a large Atari investment. Anyway....to reiterate the point, how about some details of running "any" ST on the web? One more time and see if you can get it this time....What resolution does the browser run in? 320x200 in 16 colors, 640x200 in 4 colors, or monochrome?

Thanks!

James

Oh....now we're just talking about a standard ST and a $150 hard drive? Oh...last message you made it look like we were talking about an "Omnicrom" (or whatever) graphics upgrade box that costs $400. Yeah, $150 is cheaper than a new PC, but there are compromises to running ANY

ST, not one with several hundred dollars of modification. If we're talking about the $150 (as you say above) plus the ST that's one thing.

>
> >"Full color?" What do you mean? How many colors is that ST going to put

> to begin with.

Again, you conveniently ignore the fact that we're talking about "any" ST. Ok...so now you're talking about the $150 from above, plus this Omnicrom thing....plus a monitor. You flip-flop, first talking about $150 in a hard drive being "considerably cheaper than a new PC" [note: please re-read your own ASCII three quotes above, where you said it] then digress with a querulous accusation that I "conveniently ignore graphics cards" and flop to talking about an ST with EXPENSIVE GRAPHICS HARDWARE added. I was talking about a stock ST (as in "any ST"). Finally, you unsuccessfully try to narrate my actions in your last sentence and accuse _ME_ of ignoring key points. That's really funny. What other tricks can you do? Roll-over and beg?

"Any" ST means a 512K 520ST with a single-sided floppy and a television screen. However, I guess we need a hard disk. Need more RAM? Oh, it's not a SIMM and I have to pay someone for a kit, plus the RAM, plus installation, plus shipping and insurance, plus down-time. So what are we talking about here? "Any" ST or what do I need? How many modifications?

>
> >Not a wise investment in an obsolete machine that wouldn't bring a
> >hundred bucks in a thrift store. Hell, we're talking about a machine
>
> Schools don't buy hardware for resale value, they buy it for utility.

That doesn't mean they should piss money down a rathole. How convenient for you to try to duck behind the school and miss the point that regardless of WHO is doing modifications to an ST, they couldn't sell it for dirt. I suppose you'll pretend like that isn't the case now. C'mon....give me a good performance!

> A 1970 Plymouth Valiant won't fetch much at a used car lot, but they can
> be made into tremendous performance cars.

That's a pretty crappy car. I'd go with a Satellite or Charger if I wanted an old mopar. Trouble is that the vast majority of all old cars are all worn out now (as are Valiants) and to truly restore one to like-new specs (and do it right) would cost far more than a new bargain performance car. The alternative is to find a rare, low-mile collector's item but that would cost a fortune. It's also easier to get the newer car to generate more impressive numbers. However there are many REAL NICE old

cars but they are EXPENSIVE and the owners weren't doing it to save
money; they were doing it because of an emotional attachment to the
vehicle and a desire for it. Gee....kind of like when you try to reason
with your emotion.

> Again, the teacher's main concern is accessing the Internet, completely,
> for the lowest possible cost. She already has ST hardware. She should use
> it.

Ok. Now we're talking (above) about the teacher again. Let's say she
has some 512K 520STs with single-sided drives. Would she then have the
hardware? If she had a standard 1040ST with 1024K, would the then have
the hardware? If so, what screen resolution would it run in (reference
other relevant discussion on subject)? Or does she need that $150 for a
hard drive?

> ---

> use the SC1224.

Ok...now we're talking about a $400 (??? is that right???) Omnicrom.
Well if she "already has the hardware" then she doesn't need an
Omnicrom, since "any" ST can access the web, right?

On an UNRELATED note; what is the max resolution and colors that the
Omnicrom can display legibly on an SC1224, and how much would it cost (in
addition to

In the case of the school, it's a socialist-run institution, so I'm sure
they spend taxpayers dollars a little more freely than you and I.
However, as a genral principle, it is not wise to piss money down a
rathole you can't get at least part back from. Are you going to admit
that sinking money into an ST is a risky "investment" or are you going to
duck behind the school arguement to try and conveniently ignore this
fact? If I spent several hundred adding RAM, hard drive, omnicrom, etc.
and tried to sell it on the open market, I wouln't get DIRT for it. Are
you going to 'fess up to at least this much fact, or ignore it, or deny it?

>

> >But you're such a know-it-all, Brian. How could you be confused by IRQs
>
> Personal attack, since you have no rational argument. How clever.

Personal attack. This much is true. My arguement is rational. If you're the computer "boy wonder" that you purport to be, why do you whine so much about elementary operations (to someone of "your stature") like an IRQ?

>
> Another one. James, you're golden!

Try to play narrator and ___totally____ dodge what I was saying. I was saying that you KNOW HOW MANY PCS ARE IN OPERATION and many run by dolts who are able to do it. They wouldn't be as popular if they were as bad as you like to think. Are you going to keep ducking by lapsing into narrator mode, or are you going to at least try to contend with the points that I bring to your attention?

>
> >country would come to a grinding hault if every pinhead that operates a
> >Wintel PC got snagged like you do with IRQs and installing WIN 95.

Contemptable??? Is that what your emotional reasoning powers tell you?
The demand is because they are cheap and they follow standards.

Contemptable for you, perhaps, which doesn't surprise me.

>
> >They're both pretty easy for me. Maybe you're not so smart after all.
>
> Yet another one!

Whoops! You're in narrator mode again because you wanted to say something smart but it just didn't come to mind.

> ---
> Here's a summary of your argument:
>

> this.
> -

Sorry I don't follow you. Your arguements are dis-jointed and your "reasoning" so evasive that I don't even know what you're talking about.

> 60% personal attacks.

Oh, so now you want to play the injured party. Are you going to hold your wounds out for others to kiss? Seems like a few lines back, you were accusing me of "ignoring key points" and "trying to ram them home when they're invalid." What, were you just being sweet? Were you hoping that I'd blow you a kiss in retaliation? Sorry to disappoint you.

> ---
> With numbers like that, James, you should be proud. Heck, America should
> be proud that great debaters like you exist to educate us all in the ways
> of computerdom.

Those numbers are your opinion, which is about as useless to me as most of what you say. You're the one tryig to educate us all in the ways of computerdom. You're the one trying hard to look like an expert, posting your computer resume and boasting that you make PC recommendations. I'm just trying to counter your bullsh*t. First you say you're talking about "any ST" then with a hard drive added, then with a Omnicrom added. Then you try to pretend like nobody in this world can use a PC without tripping up on IRQ conflicts..... You've demonstrated genius....at least YOUR brand of it.

James

I made a statement based on observation over the Pacific Northwest and Alaska, that TOS magazines are not distributed widely amongst newsstands as they once were. You cited an exception to the rule. There's no "alluding" going on; you need only admit that you cited an exception to the rule, that's all. The fact that Barnes&Noble has TOS magazines doesn't help the fact that I can't get one at Safeway, where PC Magazine and Mac User are, nationwide. That is my point. In your above quote, you said you refuted the point. So you refute the rule with an exception? You're the one who's "golden."

My PC was a good deal. That's all that matters to me. Why would I be pissed off? I don't care who gets the margin. I'm not loyal to any brand. I buy what's good quality at the cheapest price. You're the one who's emotionally-attached to one brand; I have no reason to get emotional (pissed).

Nevertheless, they accomplished it and since this is now and now is relevant, how long it took is irrelevant and the fact that the feat was accomplished is all that remains.

Sure, a much simpler OS without as many bells & whistles. I'm sure you'll say that OLE isn't necessary, but I've found it to be handy. So the ST owner wouldn't need that 8 Meg SIMM? So a TI 99/4A owner wouldn't either, and you'd have about as much luck getting a local shop to put in that SIMM in the 99/4A as you would the ST.

>
>   The 4Meg barrier on the ST, although present, is much less of a problem.

Less of a problem? But a couple lines up, you acknowledged that the problem was taken care of, albeit over 14 years. If you've said the problem was taken care of, then how can the ST's 4Meg barrier be much less of a problem?

I'm talking about those resolutions BECAUSE THEY ARE the standard for the ST. If we're going to access the WWW with a standard ST, then what other resolutions would you like to talk about?

> If you take the standard resolution on the pc, it will be nothing, except

I am attempting to establish that "any" ST can access the web. If so, then that doesn't mean with an add-on graphics hardware. This isn't a comparison as to whether or not a SVGA PC can display better graphics than a stock ST, so there's no "level" to talk on. I just want to know what the web pages are going to look like on the ST's dated graphics modes, since I wouldn't consider pouring money into an ST. I have no doubt if I sank hundreds into graphics hardware and memory, I could display a picture as well on an ST - but I've have pissed more money down a rathole than I care to.

Again, noone who is completely happy with WWW130 is going to post about problems they're having with it. Only the few with problems will post. There are many posts from people confused about Netscape, too. Does this mean Netscape is absolutely useless?

>I have to deal on an almost daily basis with fairly experinced Atari users in the Atari forums on CompuServe who have problems with it too.

I can just see this:

"Give up, buy a PC, the Atari is inappropriate for Internet access.

Thanks, BobR, Atari Forum Manager"

>Yes, it's better than the early versions, but I still don't think it's as easy to install and use as other similar applications on other platforms.

EVer install Netscape or other applications? The trick is in getting the TCP/IP stack to talk to your server. Once this is done, the actual applications like WWW Browsers, Telnet, etc. are not an issue. And after having installed dozens of TCP/IP stacks, I'd rate STiK as one of the easier ones to install.

>But I still don't think it's as practical a solution for the teacher in the original article as changing to a more well-supported platform.

Again, it would be easier to "switch," but it would also be expensive. If every time you couldn't tackle a problem on your computer without having to look for help, you switched machines, you'd be broke in short order. Smae with most school districts (and taxpayers).

If that's a sideways shot, it's a poor one. I've already explained how the teacher could set up and use the TOS system to sully access the Web. Isn't the need of the individual.

Ah, what the hell, I give up. It's pretty obvious that we're going nowhere fast with this thread.
-
The original question was whether the ST could easily access the net. I explained how. And since I advocated saving money through use of a still-capable system already in place, I was bombarded by people attempting to advocate purchase of new computers (which is not, and never will be cost-effective). I explained the basic philospphy of value-added, and was blasted as a "know-it-all" by the inciteful, you uninsightful Mr. Woods, despite the fact that this is a basic tenet of the free market. Fine, school district, go buy your Pentium 150's to run Netscape on. Just don't be dismayed when you get the bill, and realize your needs for internet could have been met for tens of thousands of dollars less.

>in my Masters program of school media study..

Oh, boy, Socialism 101. . .
---

>A case study was upon us where we had to develop a plan for a new media center
>from scratch.   A budget had to be proposed with a set limit. A new collection

Which makes it irrelevant, since the discussion was neither about a new
facility nor about a "media center" (fancy lingo for "library with lots
of expensive hardware that nobody uses").
---

>up the shelves. I decided not to except discarded materials using to rationize
>if its not good for their students than its not appropriate for mine even if
>the media center collection will be somewhat bare for the first year.

Well, since you have access to unlimited funds by draining other peoples'
pockets through taxation, cost/benefit analysis pribably wouldn't be
that good an idea.
---

>So, if another school or district discarded their last ST's for school use
>inorder to get upto date with Mac/PC, would I aquire those ST's? Probably

Who cares? If I were a district with STs (or Amigas, Acorns, etc.), I would
want to use the resources I've got, rather than go to the taxpayers and
say "I'm spending $70,000 to buy new computers since I found it too
difficult as a computer teacher to update the capable machines I've got."
This is where the argument centers. . . whether or not the ease of
"getting support" (questionable) for the PC, and ability to view an entire
hi-color picture on screen at once is worth $70,000. I'd say no.

That has nothing to do with the fact that I can just stick in another 8MB SIMM when I want, and I don't have to upgrade my applications to new memory-hogs, like Brian-Roland was saying. He was trying to invalidate any advantage to upgrading the memory on a PC by suggesting that I'd have a new WP program (or whatever) that would soak it up. I can buy however much RAM I want and I can install whatever applications I want, and I don't understand the comment since my ability to do either is independent.

As far as functional equivalents for those programs listed, I don't know or care. However, if there's a need for a program (functional equivalents to those programs, or any) then chances are there is one for a mainstream PC. Atari computers play a very miniscule role in the functioning of this nation. PCs and Macs keep the wheels turning. Whatever those programs do, there are equivalents because you can do anything with a PC too. There are many competing brands of software that do the same/similar thing. You know that. You're just trying to set up an arguement so you can crow about how fantastic those programs are on the Atari [and how much better they are than PC equivalents] , in your search for reasons to keep your Atari. That's fine. However, the world continues to turn with those programs playing a miniscule role, since the user base is so tiny. I guess the rest of the world is so poor, eh?

> My preference for that analogy would be a Sega Genesis (for obvious reasons).

I was using "Nintendo" as an example because the NES has only 2K of RAM, but the games are still fast and fun, and the graphics far better than any other console or computer that used a 6502 microprocessor.

If I was thinking 16-bit console, I'd say the Super Nintendo, since it has so much bettter graphics and sound than the Genesis. However, fast games on a 6502/1.8mHz sounded more dramatic.

The anecdote was the example, Einstein. There may not BE an ftp site so if I can't get on the web then I'm handicapped to that information. Since you can't seem to understand the anecdote, here's your example. The toothpaste commercial had a web address of WWW.COLGATE.COM. I want to see what's there. How do I get that information from ftp? Without web access, I'm handicapped to that information. You disagree?

Since you have apparently seen a plethora of posted problems about this package, it would seem trivial for you to share a few with us...

...and give us some insight into why the 'other' platform is NOT such a problem.

The one genuine configuration issue I saw posted would be similarly problematic for most PC's.

Depends on what she has more of time or money. In a few weeks, she'll have plenty of time. Schools are notorious for not having enough money.

Besides, she's already obviously an Atari user.

The anecdote WAS your example, Einstein. Without access to the web,
you're handicapped for information that is only available on the web.
How hard is it for you to figure out? I see WWW.DISCOVERY.COM. I don't
know what's there. How is ftp going to help me?
It doesn't. Without web access, you're handicapped to that information.

The point to re-reading my paragraph was so (hopefully) you'd finally
realize that without web access, you're handicapped to that information.
Seems pretty simple to understand, but since you had difficulty with the
concept and instead wanted to argue that web access could be equalled

through text-only means, I hoped re-reading it might help you.
Re-reading your replies isn't an option because it isn't as funny the
second time, which is the only reason I read it the first.

Get used to it, Mac. If that wasn't the ongoing trend, we'd all still be
using 16K. What you fail to mention is that computing resourcs have
gotten much cheaper too. Could you get 1 gig drives for $200 3 years
ago? Could you get a meg of RAM for $25?

Just adding OLE alone (an God knows what else) to the ST would make an OS
the size of the ST's baloon. Just because you double click an icon to
run a program doesn't mean you can do everything Windows does. For
turning a machine based on an archaic architecture into a point-and-click
machine, Windows does quite a lot, slow as it is. Added features equals
added bulk. I'm not totally disagreeing with you on this point; Windows
is a hog. However, it does do more than the ST OS.

Yes....the above, which explains to you that getting on the net and web
is as easy as opening my mailbox, which isn't the case with your
proprietary computer.

Ohhhhh.....now you want to quibble.... Of course I meant to access the
internet, which ment "getting online" to begin with. Those services (the
ones whose disks I format and use) all offer net and web access, by the
way. Please don't try to dodge the point by trying to quibble.....

>   Stalker will get you online. It will even get you online with CI$.

Slot modems ARE significantly cheaper.  External ones are plentiful, and
they will be, at a higher cost.

>

Yeah, I can use MSWord 5 and print my document. However, I'm not
HANDICAPPED TO INFORMATION like someone who doesn't have WWW access. Big
difference.

> Although I should have been more clear: THIS YEARS software is not really
> necessary.

Of course THIS YEAR'S software isn't necessary. Last years still works fine.

>
> Ancient VanTerm does not deliver me much more in the way of utility than
> this years version of ProComm.

Last year's ProComm still works well too, as does the year before.
What's your point? There does exist old versions of PC sofware too. Just
because you can't get new software doesn't mean you have to spite it.
BTW, I'll bet ancient VanTerm isn't so good at 28.8 KBPS, kinda like the ST.

>

Really? They don't seem to slow down its popularity. I'm sure it does
have its problems, but when you PC bashers say PC software has "bugs for
features," it's a fantastic embellishment.

Uhhh, not "an additional box" but a cable adapter. It looks like a "Y"
with standard MIDI ports on one side and a joystick pass-through on the
other. The right signals are there, just the connector is different.
Hardly the same as what's required to turn a proprietary Atari interface
into something the rest of the world uses.

It's been entertaining, although it grows tiresome as of lately.

Then what was the problem? Why did't she plug in the modem? What was
the stimulus for the story to begin with???? If she had a PC or Mac,
she'd have been online instead of having the story. AIN'T THAT SO?

Interestingly enough, it was in this general timeframe when Bobby's
comments
would have been true. That state of affairs, and the obscene price of
Atari
hardware (and relative expense of Apples) led me to clones.

However, things have changed. SLIP finally came to GEM.

>flamed Mac/PC users for their choice.. I decided to state facts about the

Actually, that bit would probably be more appropriately aimed at me.
Bobby is of the: "I now have a PC, the Atari is completely useless now"
camp.

I'm more of the: "A Turing Machine is a Turing Machine" & "We will make it
work even if it doesn't want to" camps.

"Buy PC's (or Apples)" might not be the best recommendation for someone
with
a room full of Ataris and a tight budget.

The majority of the microcomputer market doesn't want to acknowledge
older
machines (even older PC's). (and no; ancient software that's less than
ST caliber
being sold in bargain bins doesn't count as significant
acknowledgement).

I'm curious when this popped up?
Nevermind it has to be just about the most loaded PC example available.
There is BIOS support for VGA and all of the hardware i/o settings are fixed.

Drivers for non-standard resolutions can be a pain however.

WHO was complaining about the difficulty in installing a VGA card again.

>are an "expert" and they can't install an internal modem or VGA card in a
>PC (provided they had instructions, like all new VGA cards come with),

Well, now this is a bit more relevant. Installing a modem can be rather hairy
if it is NOT THE ONLY 'expansion card' you have. Not all PC's are consistent
in their behaivor given a common configuration. One significantly differing
component can cause problems.

Also, the built in irq/baseaddress monitor is faulty. That is why there are various
and multiple replacements for it.

>then they must indeed be stupid. That's not "everybody." As a matter of
>fact, PCI is very popular today and has pretty much become the standard
>since the Pentium push got underway. PCI is "plug&play." Even the new

PCI = buy new system (or at least motherboard).

Legacy is a rather sticky problem with PC's: hardware and software.

>Macs are using PCI. What's so hard? Maybe they're the type who needs a
>video to watch first....hardware sold under the mass-market package name
>"Reveal" comes with a VHS cassette and a 1-800 number for people like

Again, WHO claimed that installing a VGA card was difficult (as opposed to
broader generalizations that may have by their nature allowed you the room
to rant such as above)?

With a mult-i/o board with all of it's ports active, no documentation, and a creative
labs card also inside: an isa modem would likely be beyond the skill level of most
users.

Windows 95 wasn't ready for the level of information hiding that it presumed
it could do. The setup wizard could really screw over a novice user BIGTIME.
Also, the configuration itself is rather unstable as well as not consistently
supporting rather common hardware (well).

Actually, not many complaints about 'doze stability have been hurled about
lately.

However, if you use the system capabilities as advertised (serious multi-tasking),
you will likely break it frequently.

One could coddle the system (NT doesn't need to be, neither does LINUX).
However, doing so limits the utility of a Wintel clone significantly, erasing much
of it's advantage over an ST.

Once again, you cited an EXCEPTION to the rule. Won't you acknowledge that? Don't you know that the Atari days are over? Hell, man, in 1986 one couldn't even blow hard (as you do) about the availability of TOS magazines. Now that the ST has long since disappeared from stores, you expect anyone to believe your denial? All I am trying to say is that RELATIVELY SPEAKING, relative to both how Atari magazines USED to be distributed, AND relative to how PC and Mac magazines are now distributed, the rule is that there is not widespread distribution of TOS magazines. I don't know how you could argue otherwise. You just like to argue and you can't stand to lose, no matter how preposterous your stand. That's fine. Why don't you try going into a B. Dalton's or Waldenbooks and find some TOS magazines? You might have in the past. You won't now, because there things are not like they used to be and there is no longer widespread distribution. I don't know how to spell it out for your sorry ass any better than that. You'd argue with a signpost, wouldn't you? Have fun living in denial.

Yeah, looks like like your brand of bullsh*t, alright. What about a guy who buys a vehicle in basically good shape for wholesale (low book value) or less, spends a little on polish and two-tone paint, a little trim and clean-up, and some used wheels and tires. Those things cost; they are an "investment" into the vehicle. Then, the vehicle is sold for high book, or somewhere close. Money is made. I know a little something about this. That's an investment made for resale value, much as people fix up houses sell them for a profit. You really don't have any economic sense. YOU'RE WRONG!! Not surprising coming from you. The fact that you said that shows how truly narrow-minded you are. I cite it as proof.

Umm...sorry to dissappoint you, but the TT quite happily uses ST and
TT-RAM together. You can even tell it to run which program in which RAM.
ST-RAM is for 24-bit addressing compatibility with older software, and
the video. TT-RAM is for full 32-bit addressing and burst mode
operations. TT-RAM can deliver 80 MB+/sec of addressing if used correctly
(burst mode and caching used). All from a 32 bit, 32MHz CPU and 32 bit bus.

:)

How do you add a graphics card to an Atari 520ST? I'd like to see that. You must be talking about PCs if your're talking so nonchalantly about changing graphics cards. You can get VGA cards for $20 for PCs; how much (if this is possible) would it cost to "change the graphics card" on a 520ST or 1040STfm?

> However, it would also cost several hundred thousand dollars.
> The added utility of being able to view pretty pictures in all 256
> colors is most likely not worth the additional expense.

Good grief. Don't try to make it look like they need three-quarters of a million dollars to "look at pretty pictures." They need a low-end PC or Mac to do it easily. Who says 256 colors is just for viewing pretty pictures? Any picture would be at least somewhat accurate. Maybe they want to look at digitized maps or something that requires detail. Now we have to pretend like crappy graphics capabilities are all that's required, or pretend like seeing pictures as close as possible to how they actually are is not an advantage?

> And if one
> was willing to add features to the machines to get these pictures,
> s/he could purchase a graphics card and get decent video (even on a stock
> 1040 STfm).

How about some REAL details about how to do this to a 520ST or 1040STfm? How can I show 256-color graphics? What kind of resolution and color pallette are you talking about upgrading the 1040STfm to, what is involved, how is it installed, how much does it cost, and what software is compatible with it, where do I get all this stuff, who can install it for me, how much will it cost for installation, etc.?????

Sounds to me like investing all the above into a 1040ST that's hardly worth a lousy hundred bucks (and won't bring much more after all the expensive modifications) would be a pretty poor investment. One need not

try to sound like a blowhard/know-it-all spouting "revolutionary business
concepts" to understand that.

What's unique about the ST's MIDI ports? Any clone with a Sound Blaster
or compatible has MIDI output on the "joystick/MIDI" port. This has been
since the first 8-bit Sound Blaster made its debut. Most "contemporary
clones" come not only with 16-bit Sound Blaster capability since CD-ROM
and "multimedia" became popular.

It's not that big of a deal to anybody that they'd want to waste time researching who you are. I wouldn't call anyone "so damn lazy" because they don't care enough about you to research into who you are. Why would anyone want to waste thier time doing that? If I thought if could somehow improve your slumberous intellect, then perhaps. Despite all that, you look like you have something to hide, or you're just some lamester with a second alius trying to have some fun.

Hi, Bobr
     It seems that you are angry with atari users.
     I just want to talk to you as a computer user not an atari user.

```
     Firstly, I don't understand why you want to compare an st 8Mhz
        and a brand new PC. The st was created 11 years ago.
     An st cost nothing. You can find some for free.
     If you want to compare atari and PC, you better choose something
        like the Medusa, or the afterburner or the future Barracuda.
     I completely agree with you when you say that it may be better if
        the teacher choose a PC for Internet. Or even a mac, I think
        everyone can understand that.
     Secondly, about STik and Cab. Could you imagine how the programers
     are good. Can you realize? It's the biggest challenge I ever seen
     in the computer world. To be able to surf the net with the oldest
     ST 8Mhz, without any extra hardware. Just 520kb memory and every
     screen will work to. No need to get a High Resolution etc.
     They really did a good job.
     Cab and Stik work very well now, no problem. And remember , Stik
        and Cab are still Beta version, so it is evident that you can not
     call them via an 1.800 number.
     Please, Atari have enough problems, And it is true that I can not
     go out and buy easily some atari products.
     But what for, to buy the latest CD ROM Mickey MOUSE screen saver?
     I really don't care. When I need, I mean NEED something, there are
     enough good shop do get what I need. Even if I have to wait 3days
     to get it.
     That's all for the moment, talk to you later, Bye.
```

```

I had 4 MB in my 1040STfm with the "Z-RAM" kit. 4M wasn't "standard" in all STs, only the expensive ones. For much of the time of the ST's life, Atari never made it easy to upgrade RAM. Good thing for third parties, but not to Atari's credit. There was no point in time when ALL ST's HAD 4 MB STANDARD. If you wanted to pay for 4MB, you could get it. You could also get any amount of memory on a clone if you wanted to pay for it. Don't pretend like Atari invented the idea of having 4MB.

Right. That's been the case since micros started coming home. PC's are memory hogs, but you can't blame the entire scenario on them.

> >I'm sure there's a guy running CP/M on a 4 mHz Z80 with 16K thinking the
> >rest of the world is a bunch of fools.....which brings us to Atari users
> >who (with imposed 4MB limit) scoff at modern PCs.

>   MODERN does not necessarily mean better. MODERN only means NEWER.
>

By using the term "modern" I was hoping you'd think of the fact that even the skimpiest PC configuration (in 1996) has 4MB or 8MB. The point was that the guy with the 16K Z80 would scoff at a 4MB computer (of any brand) as having "too much needless/wasted memory," just as a 4MB Atari user would scoff at my 16 megs and "bloated" system. I wasn't hoping to incite a debate about the meaning of the word "modern."

Good greif, man. You really think you're that smart? I never said they were "Internet Software developers." I meant that they merely provide software to access the internet and web through THEIR service. The point I was trying to make is that they make it _that much easier_ for a PC/Mac user to get on the net/web. I know what they are, YOU BOZO. The point is that if you use thier service and software, you're at least online easily if you have a mainstream computer platform. Jeezus quit trying to read into things further than you can because you make the wrong assumptions and misinterpret what I'm saying (missing the point entirely) and then try to correct me (going so far as to spout "Now you truely show your ignorance") and when you're so haughty about it, it only serves to show YOUR "true ignorance."

>

> >self-abusing enough to try it, the option is there.
>
>   And very expensive. Not all of us are made of money. Try Netcom.
>

Yes, but that's another issue. The fact is that it's just one of many avenues for accessing the net/web that's available to mainstream computer platforms. True or false: Mainstream computer platforms are easier to get online because they have more options to do so, and more assistance for users who may have trouble. No arguements or qualifications; true or false?

>   ISA cards are becoming fewer and fewer. They are as much a dying breed
>   as Ataris. Even VESA is in decline.

ISA isn't in danger. Yes, VESA is in decline because of PCI, but it doesn't cost anything to leave in a few ISA slots. There are too many cheap modems, sound cards, and scanners that don't need 32-bit slots to perform fully. Just because VESA is in decline doesn't mean ISA will disappear for devices that operate beneath ISA's limitations. Who wants to use up a PCI slot for a $40 modem? By the way - cheap internal modems and cheap sound cards are two things that plug into a 386 that won't plug into an ST. I can find shareware in the bookstore or a $6.99 Calculus CD-ROM at Toys R Us that runs on a 386, and I can't for an ST.

>
>   Software is hard to come by, but not really necessary. When you're software
>   doesn't come with bugs as features, the need to get this years addition
>   is not quite as great.

Oh, so now not only is Web access not really necessary, but we don't need software either. Brilliant arguement son, really brilliant. Bugs aren't standard features? I guess the "black page syndrome" that some people have with AtariWorks is a feature that the latest Microsoft Office doesn't have yet?

>
>   SCSI harddrive is still a SCSI harddrive as is a modem or printer.

Ok. Thanks for the info. Let me know if those SCSI harddrives change
into something else, and keep me posted on those modems and printers and
let me know if they morph into something else. Take another bong hit
while you're at it.

```

>                          platforms...
```

Forgive me for being honest. Far be it from you to admit that you don't
know EVERYTHING. However, I have used Netscape on a 386 and it seemed to
me that the real slowdown was the net connection and not the PC's
processor. Having admitted that I know relatively little about Netscape
does not invalidate my experience, but it does serve to show that at
least I'm somewhat humble; you could use some humbleness yourself (a lot,
actually).

I don't see the FTP sites advertised like web sites. Many times I see someone advertising their web pages and I email them asking what the FTP site is and they say that anonymous ftp logons or access to the proper directory is not available. This is a reality sometimes, whether or not you like it, or whether or not you'll admit it doesn't matter.

I was tallking about the 68000 (sixty-eight thousand) having an addressable limit of 16 meg. I didn't say 68020+. Therefore, where is the fiction? I was trying to raise the question (it has since been answered) of why the ST had the 4MB limit when the 68000 can address 16 meg. The 68020 and subsequent releases had no bearing on the arguement because the subject was the ST based on the 68000 microprocessor.

You are changing two variables in the comparison. To test the effect of manipulating one variable in an experiment, you have to hold the other variables constant. Additional RAM grants you certain privledges (maybe to run additional bloated programs) and different programs offer you certain privledges (maybe new features) but they are different. Just because I upgrade my RAM doesn't mean I have to change my word processing program. I can still do all the things that more RAM allows me to do without changing WP programs.

That's true. One only need turn on a Nintendo to see the opposite of
bloated code....very little RAM, a slow processor, yet FAST games.

Actually, I'd take the pushrod V-8 ANYTIME over the sucky supercharged
V6. Chevy's newer "LT1" 350s make 260HP, 275HP, 285HP, 300HP, 305HP, and
330HP in the "LT4." The 1996 285HP Camaro with this 350 will blow the
doors off the weakling (with troublesome, non-durable supercharger) V-6
and all the 350s offer around 330 lb-ft of torque. I believe the 96
Camaro V8 (285HP) gets a 25MPG bill from the EPA, so there's no advantage
to the Pontiac. A better choice Pontiac would be the Formula Firebird or
Trans Am.

Good grief. Fujiboink was TEN YEARS ago. The 8-bit Atari could do that
one well, and the sound was better than the cheesy ST version.
ShinyBubbles was neat then, but a Super Nintendo could do better in
1991. What's the big deal?

Hard disc drive makers and Intel give M$ a kickback as it forces users to buy larger drives/faster processors, both of which carry higher profit margins.
</industryScuttlebutt>

So... I'm glad I use a TT.

Unfortunately, I can not say the same.

In a moment of weakness, I purchased a copy of "Programming Windows 3.1".

What it revealed was a mass of spaghetti that one must write to get a functional program up to run.

The philosophy of two separate areas of RAM on the TT is even better than that implemented on the current PC Groan.

Have one area for hardware access only, and another for software.

So sound, video, serial, MIDI all access ST RAM, whilst software programs run in 32-bit RAM. Neither hardware or software conflict with one another.

Unfortunately, programmers being inveterate hackers tend to use undocumented hacks which have made the programs require ST "slow" RAM.

Therefore, this pristine, high-level overview breaks.

All software I write is (I hope) immune from "needs to be run in XX RAM".

It's hard to find a 20 Meg drive. By the time you pay for an external case, power supply, cables, and ST host adapter, you'd be a fool not to get a bigger drive for a few dollars more anyway. If I have NO hard drive, chances are it will cost me more than $100 to get one running for everything included. Remember, we're not talking about plugging in an internal IDE drive on a PC, in which case $100 is entirely feasible.

"Full color?" What do you mean? How many colors is that ST going to put on the screen? "Full color" better mean 8-bit color or better, not 640 x 200 in 4 colors.

> ---
> If greater graphic resolutions are necessary, cards that interface directly

Not a wise investment in an obsolete machine that wouldn't bring a hundred bucks in a thrift store. Hell, we're talking about a machine just this side of a TI/994A in resale value. $400 plus another $300 for a monitor? No thanks. Couldn't give it away after all that expense.

I don't know about you, but it's unpractical to ME to spend several hundred dollars on a computer whose only future is on the shelves at Salvation Army Thrift Stores. Most people wouldn't give a hundred bucks for a fully loaded 1040ST even if it was a good deal, simply because they're unfamiliar with it.

But you're such a know-it-all, Brian. How could you be confused by IRQs
when you're so much smarter than the rest of us? That's the dichotomy
with you PC-bashers. You're so highly opinionated and claim to know, but
when it comes to potential PC snags, you act like a helpless little
wuss. Come on....you know how many PCs there are in operation and the
country would come to a grinding hault if every pinhead that operates a
Wintel PC got snagged like you do with IRQs and installing WIN 95.
They're both pretty easy for me. Maybe you're not so smart after all.

James

Isn't that a typical "screw the user" Atari policy? They want you to
throw your machine away when it's time to upgrade to 4 megs..... Imagine
built-in obsolescence (in the form of soldered-closed sockets) so you'd
have to buy a new computer just to gain 2MB of RAM.....and we all thought
the PC platform was bad about inevitable obsolescence.

Some computer stores are. Some are not. Computer stores vary. No generalization will always apply, except the one that they'll laugh you out if you're looking for help with your Atari. Don't ask us to conveniently pretend that ONE HUNDRED PERCENT of computer stores are completely useless ONE HUNDRED PERCENT of the time, merely because you can't get Atari service/help there. (You should realize that you have a tendency towards "sour grapes" and try to avoid such claims that are so obviously that way.)

It's been years since I've seen an Atari computer magazine on the newsstand. Last one I saw was Atari Explorer. I hope that by citing whatever the case may be at "Barnes and Noble," you're not asking us to believe that there is widespread distribution of Atari-related literature amongst newsstands? You are more intelligent than that, I hope.

Yeah, but STeve's will soon dry up like most Atari outlets have. The clone companies aren't going anywhere except moving up the NASDAQ. I'll bet that really pisses you off, eh? Heh heh.

No. ST's were superior to PCs in 1985. That's a hands-down issue. PCs were overpriced and just plain sucked in 1985. I don't think there's anyone here trying to dispute that fact. But it's not 1985 anymore and things have changed, and some people seem to have difficulty warming up to that reality; they don't ask about 1985 PCs because it's not 1985 anymore.

I didn't say it did. He asked WHAT KINDS OF ACCELERATORS I COULD GET FOR A PC. I was a very stupid question, because there are a sh*tload of accelerators for the PC and he naively asked as if he thought he was putting us on the spot with a difficult question.

> ---
>
> >(2) 386SX can get a clock-multiplied 486slc
>
> Obsolete.

So is an ST. However, he asked and I answered the question. I didn't say it wasn't obsolete. He didn't ask for "non-obsolete" accelerators. He asked for accelerators and didn't ask about the practicality or functionality of them.

> Incorrect. The ST and all following Atari and other systems use a DMA bus, which uses a flat memory model. Various pieces of RAM can be accessed almost simultaneously due to this design. It also greatly lowers processor overhead.

That's funny. It's been years since I read the January, 1985 issue of BYTE magazine. However, I do remember eagerly reading the article and

reading that that the video hardware and the
CPU took turns accessing RAM. At 8 mHz there was no waiting, however,
and there was no slowdown. You say that's not the case? Maybe I'll find
time to read some microfilms next time I'm in the library.

That is a totally ridiculous, totally embellished exaggeration. As a TOS
user and a PC-basher, you'd like to believe that, wouldn't you?

James

Yup, folks, we should surrender. It's hopeless - Peter Sinclair-Day
disagrees with us. We are incorrect. He's obviously used CAB and WWW130
and seen just how superior E-World is to it. Oops, did I say E-World?
Sorry.

>The Fud that ignores the ST? Can't you accept the fact that the world has
>moved on...

Yep, the world has moved considerably past the 1040. . . toward an open
architecture like the Medusa, with PCI and open OS development.

Apple's style of closed-ended OS development and closed hardware truly is
drawing to a close, Peter. You're absolutely right. With the $50 StrongARM
chip, Pentiums and PowerPCs will soon be only remembered as HOT, expensive
failures.

>changing graphics cards. You can get VGA cards for $20 for PCs; how much
>(if this is possible) would it cost to "change the graphics card" on a
>520ST or 1040STfm?

The cost of the card is irrelevant for several reasons:
-
1) You need to buy a new PC to put it in (more expensive than the priciest
TOS graphics cards.
-
2) Installation of an ISA VGA card is hellish, requiring BIOS modifications
and DIP switch flipping.

>Good grief. Don't try to make it look like they need three-quarters of a
>million dollars to "look at pretty pictures." They need a low-end PC or

They need new computers and new graphics cards to do this. A T-1 line
wouldn't hurt, either. This costs thousands of dollars and requires
replacement of several dozen capable computers. A 30-workstation Win95
system would cost $40,000 alone. Quite a hefty sum. That doesn't include
software or the $700-$10,000 per month T-1 line, either. I've helped install
several of these systems, I think I'm qualified to comment on cost.

>pretend like seeing pictures as close as possible to how they actually
>are is not an advantage?

Is it an "advantage" worth $2,000 per new machine? If so, by all means, get it.
I doubt it would pass the acid test of most school districts, though.

>try to sound like a blowhard/know-it-all spouting "revolutionary business

Most places I've been to have 20 meg drives they're liquidating for around
$10. SCSI units, cheap. Add a case and host adaptor, it may be $150.
Considerably cheaper than a new PC.

>"Full color?" What do you mean? How many colors is that ST going to put
>on the screen? "Full color" better mean 8-bit color or better, not 640 x
>200 in 4 colors.

Again, you conveniently ignore graphics cards. Apparently, this is how you
argue. You ignore key points, and try to ram them home when they're invalid
to begin with.

>Not a wise investment in an obsolete machine that wouldn't bring a
>hundred bucks in a thrift store. Hell, we're talking about a machine

Schools don't buy hardware for resale value, they buy it for utility.

A 1970 Plymouth Valiant won't fetch much at a used car lot, but they can be made into tremendous performance cars.

Again, the teacher's main concern is accessing the Internet, completely, for the lowest possible cost. She already has ST hardware. She should use it.

>just this side of a TI/994A in resale value. $400 plus another $300 for
>a monitor? No thanks. Couldn't give it away after all that expense.

Again, a red herring. The Omnicrom and most other video cards will still use the SC1224.

>I don't know about you, but it's unpractical to ME to spend several
>hundred dollars on a computer whose only future is on the shelves at

Because you're more concerned with the machine than the usage. We're not buying tthe hardware to resell it.

We're buying it to access the Internet cheaply and effectively. That's what the whole thread is about.

>But you're such a know-it-all, Brian. How could you be confused by IRQs

Personal attack, since you have no rational argument. How clever.

>when you're so much smarter than the rest of us? That's the dichotomy

Wow, another one.

>with you PC-bashers. You're so highly opinionated and claim to know, but

A third one, we're getting a winning streak here. (I'm such a PC basher that I install them on site on a weekly basis, and recommend Netscape Web Server under Windows NT for my larger clients).

>when it comes to potential PC snags, you act like a helpless little
>wuss. Come on....you know how many PCs there are in operation and the

Another one. James, you're golden!

>country would come to a grinding hault if every pinhead that operates a
>Wintel PC got snagged like you do with IRQs and installing WIN 95.

Most don't ever use all the capability of the machine, which is why the demand to buy one is so contemptable.

>They're both pretty easy for me. Maybe you're not so smart after all.

Yet another one!

Here's a summary of your argument:

40% ignoring cheap graphics cards and hitting on a moot point relevant to this.
-
60% personal attacks.

With numbers like that, James, you should be proud. Heck, America should be proud that great debaters like you exist to educate us all in the ways of computerdom.

BobR,
Actually, there is a board out called the Marpet board which allows
the ST to use 8 megs of RAM. Of course, you knew that because you're
informed, right? Or at least that is what you've been claiming.
I am also tired of you talking about how difficult it is to install
STiK and CAB. Have you tried WWW130? Boot up your STe and give
it a try. It is EASIER to install than Trumpet Winsock, IMHO.
Want help? What is wrong with comp.sys.atari.st? Also, is MultiTOS
that tough to install? I didn't think so. Came with decent
documentation. Besides, you don't need MultiTOS or Mint to run STiK.
Did you just decide to throw in a red herring for fun? Or are you
misinformed? I could choose to run Magix or Geneva with STik or
use single tasking. CAB runs with 1 meg of RAM, btw.
Again, though, a majority of schools are using Lynx for their web access.
So, again, I ask you, why can an ST not be used?

James,
Interesting way to turn around an argument. BobR comes into this
group ranting that only a rocket scientist could configure a web browser

for the ST. Then, when someone points out the difficulties of
using a PC, you use pretty much call them stupid. I know a person
who is getting a 4.0 in her third year in Physics and her PC always
gives her headaches. Besides, we were comparing the difficulties
of use for a teacher wanting to connect to the Web. Both systems
have advantages as far as ease-of-use. I have heard quite a few horror
stories about Windows 95, btw, in PC magazines. Furthermore, I have
a friend running Netscape 2.0 under Win 95 and he thinks it is
very unstable.

Well... I can't speak for anyone else, but I chose to use, and support OS/2 for
one very
simple reason. It does the job I need it to, on the one system that is most
important
to me, namely... MINE. To date, I have yet to be convinced that anything else
will do
any better. Although I have few peers when it comes to frustration over IBM's
aparent
lack of support for their own product, this does not change my primary reason for
using
OS/2 in the least.

I just happen to think my rationale is simple, straightforward, and hard to argue
with.

I also encourage others who feel that some Microsoft offering better suits their
needs
to use it.

Your notion that we should cut-out whatever groups in this cross-post we deem to
be
appropriate is incorrect. If I am responding, then I wish everyone who read your
post
to see mine as well.

I will always encourage people to use what works for them, but if I see statements
regarding OS/2 which I percieve to be incorrect, then as an OS/2 "Advocate" I will
endeavor to correct them.

Bob M.

Backwards compatability is very good as the same instruction set is
used. The main problem is due to the change in the pipeline length that
some self modifying code may not work as expected. But most software
should work fine apart from being a lot faster.

As for process size, Spec95 scores, etc, I suggest you look at the
Digital WWW site.

This isn't "industry scuttlebutt."
This sounds like a "sour grapes" attitude from a pissed off fringe
group. Yeah right....hard drive manufacturers are getting "kickbacks."
How CHEAP are 1 GIGABYTE hard drives now? Is it less than $400? I
haven't looked. Is it three-hundred-and-something dollars?
HOW MUCH WAS IT WHEN WINDOWS 3.1 CAME OUT??? You can get a 1.2 GIGABYTE
hard drive now to load your Windows 95 on for about half of what that
340 MB drive cost you the last time Windows was updated. Yeah....there's
a real potential for high profits and "kickbacks" when hard drive
bargains and increasing megabyte/dollar ratios have FAR exceeded even the
appetite of Windows.

HI, Why are you talking about those reolutions, those are the standard.
If you take the standard resolution on the pc, it will be nothing, except
text. But you won't talking about that because when you buy a PC the
graphic card is already in the computer.
So let's talk on the same level. And st with graphic card displays
exactly the same as a pc with a graphic card. That's all.
Bye.

Why are you complaining? processors and hard drives have gotten faster
bigger and cheaper. Everyone benefits from faster and cheaper hard
drives and cheaper RAM. Everyone benefits from faster and cheaper

processors. Mac and PC users get faster computers cheaper and Amiga
users get real cheap set top boxes so you can enjoy going blind viewing
high-resolution graphics on a TV set.

I'm seeing 1 Gig SCSI internal drives (fast, brand name) for around
$260, and have heard of 1 Gig IDE drives for under $200. :-)

That was really cute..!

>it$ ju$t more money for Billy boy$ retirement fund. I remain a non-contributor.

Ah.. so instead you pay $900 for a $79 video card..?

And end up with a still obsolete system..?

Sounds pretty smart to me..!

>you'll sink before swim with the amount of money that M$ will get out of
>you before too long...

And do a whole lot more work than with an obsolete Atari system at the same time...

Atari computers do have some strengths remaining, but you don't seem to know what they really are.

>The limit you have stated is complete fiction. The 68020+ have no such limit,
>the 16 meg limit on the 68000 is due to the architecture of the chip itself..

Umm.. no..

The "limit" James was talking about is the 4 Meg limit on memory in the Atari ST computer design.

That limit is because of the HARDWARE DESIGN of the ST.

The MMU chip does not have enough address lines to fully address the 16 Meg address space of the 68000 CPU. It was done that way to keep the costs of the chip and the motherboard design down.

It's just as artificial a 'limit' as the '640K RAM limit' in DOS machines is.

>ATTENTION: The World Wide Web can be accessed GRAPHICALLY using an easy-tp
>install package called WWW130!

>It seems that you and Bob continually gloss over this fact.

No, I've mentioned WWW130 before, and I acknowledge that it's a very good programming effort.

But if it's so easy to install, why do we see so many articles in both comp.sys.atari.st and comp.sys.atari.st.tech from people having trouble installing and configuring it..?

I have to deal on an almost daily basis with fairly experinced Atari users in the Atari forums on CompuServe who have problems with it too.

Yes, it's better than the early versions, but I still don't think it's as easy to install and use as other similar applications on other platforms.

And, it's still faced with the same questions:

WHERE does the teacher in the newspaper story hear about WWW130...?

WHERE does the teacher GET a copy of WWW130...?

WHERE does she ask questions about it if she has trouble getting it to work..?

I'll gladly admit that WWW130 may be a fun thing for experienced Atari users to play with, and getting it installed and configured can be something really rewarding.

But I still don't think it's as practical a solution for the teacher in the original article as changing to a more well-supported platform.

Katherine Ellis writes:

>It seems you are angry with atari users.

Not at all, Katherine. In the over 12 years that I've been both a voluntary and professional Sysop in the Atari areas of three different major online services, I've always made it a point to be as supportive of atari *users* as possible. As a longtime officer of one of the largest Atari user groups in the country, I've tried to help as many people get the most they can out of their Atari systems, both 8bit and STs.

If I'm angry at all, it's with the company which took one of the best computers ever designed, and utterly destroyed its chances of success.

(What you've noticed here is that I'm not too happy with "know-it-all" types who try to make themselves sound important and knowledgable, while ignoring the needs of the individual who asked for help.)

The teacher in the original article which started all of this COULD use her Atari computers to access the Internet. I've already stated that several times now. BUT... I don't agree that it would be either easy or practical for her to do that.

If someone like that came to an Atari user group meeting and stood up to ask the same question, I'd give her the same answer: Use the Atari computers for educational programs she may already have, but get a different platform for Internet access.

I agree that CAB and Stik are pretty remarkable programming efforts. Getting the ST to do what they can do is very good, and I agree too that they will undoubtedly improve over time. But at least for now, my answer is still the same. They're not practical for a use such as the one in the original article.

There's a "grassroots" programming project just getting started on CompuServe to come up with a graphical "frontend" program for the ST which will work like the PC and Mac versions, and I expect that will run into much the same kinds of problems the CAB and Stik programmers have run into as well. I support that effort too, as it will help expand the horizons for Atari users who wish to dedicate the kind of time and resources necessary to get it to work.

So, no.. I'm not angry with Atari *users* at all...

 Beleive it or not :) but it only been rencently that I found out that
 my PC had a reset button! For the past 8month I had no idea it was there
 I didn't care a bit since I never had to use it. and the power swith was
 only to shutdown the machine for its nap.

 So in short... I have no idea what you are talking about :)

: US$100 for cooling, when you can get similar performance out of
: something for US$50?

I think P100 + fan are ~ 120$ right now?

This strongarm cpu wont eclips even a bit the x86 market (AMD, CYRIX, INTEL) because the x86 feed on MS users...

Software is the key to a CPU, sad but true.

but hey, if the Strongarm is that good and can run a x86 emulation at Pentium speed they could build some even cheaper multi OS clone with it...

I think strongarm is more of a threat to the PPC then x86

Fair comment - as far as I know, JTS also manufacture using the Tandon brand name (PCs etc) which may be a little more recognizable.

The problem with self modifying code is not because of the longer pipeline,
but due to seperate data and instruction caches. So, the modified instruction
just written isn't available in the instruction cache yet. *that* is the
problem!

However, the enviroment of the Z80 is vastly different from the PC or the
ST.
The differences between the ST and the PC aren't that striking.

>processor.  Having admitted that I know relatively little about Netscape

      Actually, the slowdown appears to be busy-waiting.

      The connection should slow down 'scape but, leave the rest of the
      machine very usuable. This typically isn't the case.

      The connection bandwidth of the modem should be trivial, even to an ST.

>does not invalidate my experience, but it does serve to show that at

You must be rather stupid if you consider windows 95 + netscape quick and easy to install. On the other hand, since you talk about a reasonable platform, you can't be talking about pc:s, right?

>How many accelerators can you get for your PC?

That clock rate can be rather misleading. It is true that the ST has relatively little muscle when compared to a current (10 year newer) clone. However, the ST had an excellent design. Well, perhaps it may have not been excellent; it just seems that way next to a clone.

I was not satisfied enough with pcs to switch over until the advent of cheap 486's. Despite thier brute force, clones are still poorly integrated and bloated. Their operating systems are bloated. GEM and your favorite application will fit comfortably into the space that Windows wastes. I was not truely satisfied with the responsiveness of clones until I used a P5/90-16M running NT.

The bloat of Windows makes virtual memory a necessity (lest you have

16M or more). Once the VM is active, the PC's cpu horsepower will
help you not. Your system is limited to the speed of your harddrive.

At this point, the 8Mhz machine runs circles around the 100Mhz one.

This makes the given clock rate very misleading...

Tis a shame the MegaST didn't come with an isa slot or two...

Quite frankly, yes? Netscape takes a visible 2.5megs + another 2.5M
for OLE. What it might even use OLE for, I don't even know. It also
spawns other hidden processes.

>I want to manipulate 1280x1024 in truecolor. Is total addressable space

Unless you're output data format is windows *wav and *bmp, 4Meg
should be sufficient.

>important now? As an aside - can't the 68000 address 16 meg? Why does

The 68000 can, in fact, address 16M (64 actually).
>the Atari have that limit - I mean WHY?? Aren't there Mac and Amiga

The ST (specifically) has that limit. It is a hardware limit (pins)
of the MMU I do believe.

>(back when they used 68000 also) with huge memories?

I was an engineering descision. It was foolish but, not too much
of a constraint.

68000 or 680x0?

>
>

>Well, I have 16 megs now. Do I want 24 or 32 megs? No, I'll OPT not
>since it's not NECESSARY. Heh heh. Joking, of course....PCs are memory

I believe the magic number I used was 16M. These days that amount
of memory will set you back 700bux retail.

>hogs but good thing a meg of ram costs much less (and consumes SOOOOOOO
>much less power) than 10 years ago. If Atari computers were still made
>today, betcha most people would have 8 and power users would want 16.

Why not ask C-Lab? They are still made today.

>Look at how the 520ST's 512K became woefully inadequate. I'm sure there
>were people screaming that 4MB was a ridiculous amount of RAM back when
>512K was fab. Before that there may have been 128K users screaming that

That's why then there were the Megas and the STe, machines that had

4M as standard long before clones. However, unlike clones; one actually
has a hard time wasting all that space on an ST.

>512K was a waste. Before that it was 64K, 48K, 32K, 16K....etc... I
>accept it as fact that PCs are hogs, but it's not like the trend of
>ever-increasing memory requirements should come as a shock to any of us.

Memory requirements are increasing faster than memory prices are
decreasing. If you are not made of money, this is a problem.

>I'm sure there's a guy running CP/M on a 4 mHz Z80 with 16K thinking the
>rest of the world is a bunch of fools.....which brings us to Atari users
>who (with imposed 4MB limit) scoff at modern PCs.

MODERN does not necessarily mean better. MODERN only means NEWER.

>
>

>years, glad for the free disks in the mail. However, its pretty

Now you truely show your ignorance. Those are not Internet Software
developers. Those aren't even Internet Service Providers. They are
large commercial timesharing systems that have just recently added
network gateways.

>commercial when all of it offers Net access and it's falling out of my
>mailbox for free, with other junk mail. Should I ever become
>self-abusing enough to try it, the option is there.

And very expensive. Not all of us are made of money. Try Netcom.

>
>
>>

```
>>     And as far as the 386 goes: it is as much an orphan these days as the ST.
>>     Everyone is developing for much bigger PC's.
>>
>>
>Yeah but I can still find every peripheral you can think of for a 386.  I
>can still run a lot of new software on a 386.  So it runs slower.  So

    If you can plug it into a 386, you can plug it into an ST.
    ISA cards are becoming fewer and fewer. They are as much a dying breed
    as Ataris. Even VESA is in decline.

>what?  How long does it take a 386/33 to balance my meager checkbook?

     Depends on how well you find software that is its contemporary on
     which to run it, or if you opt to run something coded for a much
     faster system.

>The only thing I can't do is play the latest games because they're
>hardware hogs.  However, it's a far cry from being an orphaned ST user
>who can't find _any_ software or peripherals in retail outlets.  Hell,
>you can't even find low density 3.5" disks much anymore.

    Then use the high density ones. They always worked perfectly well for
    me. Just more expensive.

    Software is hard to come by, but not really necessary. When you're software
    doesn't come with bugs as features, the need to get this years addition
    is not quite as great.

    SCSI harddrive is still a SCSI harddrive as is a modem or printer.

That's easy. Under NEXTSTEP, the virtual memory system covers all the conventional memory/XMS/EMS garbage, so you don't need to worry about it.

(Don't you all just hate clueless posters who follow up on another thread, picking up a bazillion cross-posted groups, and then change the subject?)

You want to to get a home equity line for a computer that can do all of
that instantly.

>important now? As an aside - can't the 68000 address 16 meg? Why does
>the Atari have that limit - I mean WHY?? Aren't there Mac and Amiga
>(back when they used 68000 also) with huge memories?

The limit you have stated is complete fiction. The 68020+ have no such limit,
the 16 meg limit on the 68000 is due to the architecture of the chip itself,
and is superceded on 68020 and above.

>Well, I have 16 megs now. Do I want 24 or 32 megs? No, I'll OPT not
>since it's not NECESSARY. Heh heh. Joking, of course....PCs are memory
>hogs but good thing a meg of ram costs much less (and consumes SOOOOOOO
>much less power) than 10 years ago. If Atari computers were still made

This is true - but again, what utility is added by the extra ram? If I am
forced to "upgrade" from a 386 running WinWord 6.0 to a Pentium 150 with 8
megs of RAM and Win95, with office 95, what utility am I gaining? Can anyone
actually tell the difference between output from Papyrus, WinWord 95, or

WinWord 6.0?

>much less power) than 10 years ago. If Atari computers were still made
>today, betcha most people would have 8 and power users would want 16.

TOS computers still are made, and most people have 4 and could use 8. "Power users" tend to deck out their systems to the limit, and so it can be assumed that they will max out their RAM.

>Look at how the 520ST's 512K became woefully inadequate. I'm sure there

The 520 became "inadaquate" due primarily to the demands of a graphical OS. From 1985 to 1989, demands on memory increased because there was a mass switch-over from text-based DOSes to GUIs. Such a growth in memory was required in order to gain extra utility offered by a GUI. No such radical transformations have since occurred, but RAM requirements in the PC market have risen dramatically. This is due primarily to the fact that its easier to program bloated, inefficient software and run it on fast hardware with lots of RAM. However, a market condition like the "DRAM scam" of the mid to late 80's could dramatically alter that state.

You can get from there to here in a 230 horsepower V8 Chevy Caprice, a huge car that guzzles gas, or in a 240 horsepower Pontiac Grand Prix supercharged V6, which averages around 20 MPG, and has a considerably smaller engine. The Caprice is cheaper to insure and repair, but cost of operation is _VERY_ high.

Granted, gopher is dying, but FTP is still very much alive, of not even
more vigorous, due to availability via the World Wide Web.

>All kindsa arguements made here. However, I think it would be
>frustrating to spend hundreds of dollars on modems and phone lines and
>not be able to access the fastest growing part of the net. Might be
>smarter just to ignore the net as a whole until it's time to upgrade.

But one _CAN_ use the World Wide Web on an ST.

ATTENTION: The World Wide Web can be accessed GRAPHICALLY using an easy-tp
install package called WWW130!

It seems that you and Bob continually gloss over this fact. You can access
EVERY component of the Internet on a 1040ST with a modem. EVERY component.

>(2) 386SX can get a clock-multiplied 486slc

Obsolete.

>If memory serves, the video hardware took turns with the rest of the

>system (talking ST here) for access to the RAM. I've always wondered how
>they sped this up without an amazing number of wait states, and amazing
>cache, or both.

Incorrect. The ST and all following Atari and other systems use a DMA bus, which uses a flat memory model. Various pieces of RAM can be accessed almost simultaneously due to this design. It also greatly lowers processor overhead.

>You have two totally separate RAMs - ST RAM and TT RAM. Such an eloquent
>way to do things, eh? Such duplication. Since there's all that ST RAM

Only on the TT, only if you choose to use it in that fashion. Falcons, Medusas, PAK/30-equipped machines all have the option of using a single 32-bit memory configuration (all "TT RAM", if you will). And ST/TT RAM is completely transparent to the user, unlike the haphazard PC RAM scheme, still required for use by many different programs.

>totally separate from the original conception of the PC. Yeah, video is
>card based, so it can be tailored to individual needs and doesn't have to
>fight the CPU to access system RAM.

If you are attempting to say that the ST "fights the CPU for RAM," see above about DMA architecture, which is far more efficient than the typical PC setup.

>For lots of people, the PC is like a can opener or table saw: They turn

Yep. Except that the table saw's guard breaks off, cutting off several of your fingers in the process, and the electrical current standards change every two years, requiring complete replacement of the saw in order to continue using it. In addition, replacements blades are phased out every eight months, requiring expensive upgrades. 1/4 of the time, the saw refuses to activate properly, requiring technical support.

Windows 3.x and 95 are cheap unstable systems that justify the need
for a "reset" button.
I'll stick with the VAX 4000-90a, VMS, and DEC windows. NeXTSTEP on
any supported hardware platform is hot too.

>As an aside - can't the 68000 address 16 meg? Why does the Atari have that
>limit.

The Atari ST is limited to 4 Megs of total RAM for the same stupid reason the original IBM PC was limited to 640K.

Someone made the stupid assumption that no one would ever need more than 4 Megs of memory.

However... in the case of the Atari ST, the limitation is a HARDWARE limitation. That is, you can't use more than 4 Megs of memory EVER, unless you hack into the guts of the machine and modify the hardware.

The IBM design was limited by the OS, and new OS's have elimintated that problem. Thus you can have "flat memory" extending from 0000 to gigabytes of RAM.

Next time you hear an ST owner gloating about the 640K DOS limit, hand them
an 8 Meg SIMM and ask them how they plan to use it..

Lose 95.

Sure, the Pentium may not be a well-designed CPU, but it's fast and cheap.

Of course, one should choose an operating system instead of Lose 95 to
operate such a computer.

Yeah... that's it: Front 242 was all just a dream...
...as were the various cyberstudio animations (video and otherwise)...
...as was dslide, and spectrum itself...
...as were sisters.gif,cowgirl.gif and their 50 or so odd friends...
...and those nifty *tny's of Buzz Aldron (YOU wouldn't be able to tell
it was a *tny), screens of Ghostbustser, Star Trek and Star Wars...
...Nevermind all those hours flaming about on Usenet or 'surfing' the
net at Stuttgart and Utrecht with my lowly ST, Crashlink, & a
PB 2400...
...and all of this running at Nanosecond response times vs. millisecond
response times..

<just to put things in perspective>

>
>Aha! The Front 242 reference speaks volumes. It's all so clear now..

As does Fujiboink? As does ShinyBubbles? As does Klingon Calamity?

Front242 is just a cool demo, like the rest. Any other significance is something else
entirely. (didn't get it then, didn't care then, don't now either)

Siezing upon that reference, and ignoring the others would be a rather good
example of selective perception.

You dissapoint me. There were much better references to hark upon. Although,
that might actually require some knowledge of the given domain.

BTW-if anyone knows where I might find Klingon Calamity & a win player for
it, I'd be rather appreciative.

: A 32MHz '030+'882 should be far behind a 50MHz 486DX at normal floating
: point work, not to mention integer.

My mistake there. I posted the original about POVRay comparisons. The
machine that the TT030 matched was a DX2/50. I still believe that 030/882
can munch int and fp as fast (or pretty damn close) as a 486DX...

: >When I got TT RAM it was matching it. I was also "embarressing" my

: >how much slower) but it had him "worried".
: That must've been an '040 without an FPU, or your tests were really
: _completely_ screwed up.

Maybe the Mac was using a slow port of POV, but Quadra 840AV were _NEVER_
shipped with 68LC040 'economy' version of the '040. They all were shipped
with the full 68040RC chip AFAIK.

Ciao...

I am looking for any amount of the following old toys:

Transformers
Gi Joe
He Man

Earlier toys are preferred - (80 to 84, but later is okay too)

I will purchase or trade for them, here is what I have to trade:

CASH$$$$$$$$

PC Games
Nintendo Games
Super Nintendo Games
Sega Genesis Games
Magic: The Gathering Cards - Many out of print

I really love the toys of the early 80's and if you have any cluttering up your closet, let me know and I will buy/trade them from you

reply to   Joel.M.Boblit@uwrf.edu if interested and thanks for looking

Or plug in one of several memory expansion boards that bypass this "problem" (which was in the two original revisions of Atari's custom chip). The first only allowed expansion up to 1 meg, the second took it up to four. The Tramiel theory was that if you needed more memory, you'd buy a new computer (this is why the Mega2/Mega 4, though identical computers , had solder-ed in memory to prevent expansion. In the M2's case, the extra sockets were soldered closed in many machines!)

> an apple...

The _overhyped_hamburger_ I referred to was the Big Mac. (Wasn't the 512k
Mac called the Big Mac, as opposed to the 128k Thin Mac?)

Wasn't the apple named "Mackintosh", whilst the computer is "Macintosh".
And of course, down in this part of the globe, there is a brand of toffees
with that name as well.

I have generally found that Apples "Be nice to the user" and "hide system
details from everyone" seems to slow both me and the machine down whenever
I use a Mac. I guess that means that I am just not a Mac person.

(Though the Motorola PowerStack 604/150 running a multimedia promo under
(shudder!) TheEvilEmpire's NT was quite interesting when I saw it at a
computer show during the past week).

Hmm, funny definition of cheap. How about a processor that costs $50 and runs at 200MHz? This might just count as being fast and cheap. Throw in the fact that it also holds the record for the highest MIPS/Watt rating of any cpu and it can run on AA batteries then you have what you can call a well designed processor that is fast and cheap.

I'm talking about the StrongARM processor, developed by ARM and Digital. It will soon be available for use in the Acorn RPC where tests have shown it working at 228MHz giving out 330,000 Dhrystones.

Yes, but the release from Acorn Computers/ART, giving statistics for the
performance of the SSA-110 in their Risc PC architecture does.

> Look at
> http://www.digital.com/info/pr-news/95020601PR.txt.html

And try http://www.art.acorn.co.uk/ - there's plenty about it on there,
including a jpeg of the prototype board, and launch timings for
the uncached and cached cards.

> So far its vaporware

At least it's been demonstrated, which is more than we can say for
certain other new "cheap" microprocessors which are angling for
the same market. Don't you get the feeling that Intel are getting
left behind here - why pay US$250 for a processor, and another
US$100 for cooling, when you can get similar performance out of
something for US$50?

Stuart.

Hello!

Amongst all this chit chat about whether or now Atari's can do internet stuff as well as other platforms, a thought occured to me. I do not know if it is possible, since I don't yet have a Falcon (next month! Yea!!!!), but would it be possible to run the Linux version of Netscape under the Atari version of Linux/X-Windows? If you could, that would just solve all this bickering once and for all (maybe?). I know that there are a lot of really great internet apps for anything you'd want to do on the internet (both thru Mint and thru STiK), and I do agree that CAB, still being in its development stage, is lacking in some features (PPP, Gopher, etc). But having Netscape under Linux would be a great alternative until CAB is fully featured (which hopefully will be soon). Has anyone tried this yet? Could someone try it and report back if it is possible? I don't know if it would require an accelerated Falcon or what the configuration should be. It will be one of the First things I try when my Falcon arrives.

Multiboard? That would also give TOS 2.06 sockets, an ISA slot for graphic
cards (driver software is available for ET4000 and mach32/64 cards) and an
IDE bus for cheap hdds.

Yes, and all of this can be fetched using resources other than Netscape and the WWW. Of course, if you want to use the graphical WWW, WWW130 is ready and waiting. The Internet has many different ways of getting the same information.

Actually the Macintosh computer's name had to be licensed from the High Fidelity audio manufacturer with the same name.

And, the Apple logo had to be licensed from Apple Corps. Ltd. (the Beatles' company) in england.

As I recall, the 512K version of the early Mac was called the "Fat Mac"...

>Yep, a stock ST cannot do hi-res 256 color graphics. But add a
>graphics card, and it is quite capable of doing so.

OK...

How much is that graphics card..?

We never did establish the current price of a graphics upgrade to a 1040STfm, which is probably the system the teacher in California is dealing with.

The best we got was from Thorsten, which was approximately $900US.

How can a teacher possibly go to her administration and ask for a video card which costs $900 when a similar upgrade for a PC costs $79 (and they're certainly going to know it)..?

Next... where does the teacher GET the video card from..?

We can assume from the story that she is not ALREADY connected to the net, so where will she hear about the card and where to get it..?

Local computer stores will laugh her out the door unless she happens to hit one of the handful of stores still supporting Atari computers.

There are no Atari computer magazines on newsstands anymore, so she can't find out by browsing through Computer Shopper.

How can she justify the time needed to track all of this down, when a video card for a PC is probably 10 minutes away at the local computer store?

Next... how is she going to install the card..?

It doesn't just plug into a "slot" in the 1040STfm... unless she can hack and slash and solder, she's either going to have to have someone else, who undoubtedly will not be familiar with the ST's internals, do the installation, or send the entire ST in to someone like Toad to have them do it.

Next... will all the manufacturers of the software she has send her updates to the programs to take advantage of the new card..? Can she buy VGA versions of the EGA equivalent programs she now runs..?

There's a whole lot more beyond the statement of "it can be done" to think about.

> That clock rate can be rather misleading. It is true that the ST has relatively little muscle when compared to a current (10 year newer) clone. However, the ST had an excellent design. Well, perhaps it may have not been excellent; it just seems that way next to a clone.

True, it was a good design, at the time. Somehow I doubt that ST's architecture is any superior to that of a modern PCI-based clone. No expansion, for example...

> I was not satisfied enough with pcs to switch over until the advent of cheap 486's. Despite thier brute force, clones are still poorly integrated and bloated. Their operating systems are bloated. GEM and your favorite application will fit comfortably into the space that Windows wastes. I was not truely satisfied with the responsiveness of clones until I used a P5/90-16M running NT.

Heh, that's what I'm running. NT is quite sweet, IMHO.

One of the reasons that GEM and a few programs will fit into the space taken by Windows is that GEM simply does much less than Windows can (no matter how badly). Start adding such things as NVDI (font and graphic card support), some kind of networking (if you can find any; Ataris are rather hard to connect to standard LAN's), OutSide, and you probably will have to write your own OLE/DDE etc., and oyu will end up with disk/RAM requirements as bad as Windows.

> The bloat of Windows makes virtual memory a necessity (lest you have 16M or more). Once the VM is active, the PC's cpu horsepower will help you not. Your system is limited to the speed of your harddrive.

Well, CPU power will help, as long as you don't have to swap pages. For many number-crunching applications, the amount of data itself isn't that big, so it can probably sit nicely in RAM abd be processed by CPU at whatever speed it is capable of.

> At this point, the 8Mhz machine runs circles around the 100Mhz one.

Hmm, you'll really have to show me that. My P5/90-16 box with NT clearly outruns my 4+4 TT even on operations that require VM (of course, Fast SCSI-2 also helps with VM).

> This makes the given clock rate very misleading...

Quite true, but still _usually_ a computer with a similar CPU riunning at a higher clock speed will be faster.

>Tis a shame the MegaST didn't come with an isa slot or two...

Yes, and if TT had a PCI or VLB slots...

If oyu were a bit more knowledgeable about what you are writing about, you would know that:

1. Intel had resons for doing segmented memory; they did noit do that just to

make eveyone miserable

and

2. Segmented memory does not have anything to do with 640K barrier, which is
totally dependent on DOS.

The above does not necessarily represent views of my employer,

: the same market. Don't you get the feeling that Intel are getting
: left behind here - why pay US$250 for a processor, and another
: US$100 for cooling, when you can get similar performance out of
: something for US$50?

Because you don't have to switch platforms and throw out all your software to save what realistically isn't going to amount to much of a savings in hardware, if anything at all? (Lower processor costs is no assurance of lower cpu costs.) And $100 for cooling?? A couple bucks for a heat sink is more like it.

I'm no fan of the x86 line, but you'll have to do a lot better than that to get people to jump ship.

BobR <76702.1466@CompuServe.COM> writes:

>So you're qualified to make assumptions about what the teacher in the
>original article means by "connecting to the Internet", eh..?

Sorry, Bob, but you're snivelling, arrogant tone belies reality.
---
Here is a practical TOS based setup, with details on all aspects of use
of ANY element of the Internet.
---
Account: A SLIP line running at 28.8Kbps. Cost - $20/month or $200 per
academic year.
-
Hardware: Atari 1040STfm with 20 Meg hard drive and color monitor. Cost -
nothing, already in classroom. Possible cost of hard drive - $100 for
external unit.
-
INTERNET APPLICATIONS
-
Web access: Graphical, full color with extensible formats, CAB running STiK.
Cost: $free
-
Web access: Graphical, full color with extensible formats, Chimera on MiNTNet.

Cost: $free

-

Email: POP3 based, Antmail using STiK.
Cost: $free

-

Email: POP3 based, Oasis 2.
Cost: $30

-

USENET News: Oasis 2
Cost: Same as above

-

FTP: MGFTP using STiK.
Cost: Free.

-

Telnet: STelnet, using STiK.
Cost: Free.

If greater graphic resolutions are necessary, cards that interface directly between the ST and the SC1224 are available for under $400.

STiK, CAB, Antmail, MGFTP, STelnet installation procedure:

-

1) Double click on INSTALL.PRG.

-

2) Enter IP address information, if your provider isn't already listed in the (rapidly growing) list of providers.

-

3) Click on "^Accept."

-

4) Choose multitasking or singletasking.

0

5) Click on "^Accept."

-

6) Wait for installation procedure to finish.

-

7) Reboot computer. STiK and TCP/IP programs are now ready to use.

It's really difficult and really expensive, not to mention unpractical, to use TOS. Why? Because I wish it to be so, and declare that every school district in the country should hike its taxes to pay for new computers to satisfy my ego rather than use their current capable resources.

Tell me another one. This is getting old. The capability is there and fully implemented, the installation is easier than that for Winsock/Netscape and includes vital internet utilities that netscape/Winsock lack. Finally, all of these programs can be used to full ability on a one megabyte 1040, most can be used on a 520ST. Whether or not graphics depth on a stock ST is good enough is irrelevant, since the cost of a new graphics card would still keep the price below the cost of a new PC (not to mention the frustration factor from installing Windoze 95 and keeping track of IRQ ports).

BobR <76702.1466@CompuServe.COM> writes:

>How much is that graphics card..?

There are a variety of them. The Omnicrom (sp?) is around $400.

>The best we got was from Thorsten, which was approximately $900US.

That's Thorsten, not the entire TOS market. That was a single example.

>How can a teacher possibly go to her administration and ask for a video card
>which costs $900 when a similar upgrade for a PC costs $79 (and they're
>certainly going to know it)..?

They're not going to ask for graphics cards. Having served voluntarily on committees to "Internetize" our local high school, I can tell you one thing. They (the school board) will ask for a total cost. If the cost of the video cards is lower (it will be substantially lower), the teacher will receive a budget for that. In fact, that's how it pretty much worked in one district I helped out.

>Next... where does the teacher GET the video card from..?

Mail order, same place most schools get their supplies and computer equipment from.

>We can assume from the story that she is not ALREADY connected to the net,
>so where will she hear about the card and where to get it..?

This point is getting old and moldy. First, assuming the teacher is a "she," she would simply contact her dealer. No dealer? She could check the net online via someone else's account. No account? She can call her local user group. Or ask the community for a referral. Happens all the time, with Ataris, Amigas, Franklins, etc. "She" isn't living in a void devoid of information. If "she" was a good, up-to-date teacher, "she" probably has subscriptions to Current Notes, STI, or other literature dealing with "her" particular computer line.

>Local computer stores will laugh her out the door unless she happens to hit
>one of the handful of stores still supporting Atari computers.

And computer stores are generally helpful in getting you service for your PC or Mac? Computer stores are a good source of help? Wow, tell us another one.

>There are no Atari computer magazines on newsstands anymore, so she can't
>find out by browsing through Computer Shopper.

BZZZT! Wrong, go to Barnes and Noble, I count three titles for TOS machines.

>How can she justify the time needed to track all of this down, when a video
>card for a PC is probably 10 minutes away at the local computer store?

Well, sure, the VGA card would be easy to buy, but it wouldn't work too well in her 1040STs. . .

>It doesn't just plug into a "slot" in the 1040STfm... unless she can hack
>and slash and solder, she's either going to have to have someone else, who
>undoubtedly will not be familiar with the ST's internals, do the installation,
>or send the entire ST in to someone like Toad to have them do it.

Wow, you seem fixated on this concept of "difficult installation" on a 1040.
The installation procedure is as follows:
-
1) Find cartridge port.
-
2) Insert graphics cartridge.
-
Considerably easier than the dip-switch-flipping and BIOS adventures on the average ISA PC.

>Next... will all the manufacturers of the software she has send her updates
>to the programs to take advantage of the new card..? Can she buy VGA versions
>of the EGA equivalent programs she now runs..?

Uh. . . VGA and EGA are irrelevant term, here.
-
In terms of the card on the 1040, a VDI driver is included that allows full display of GEM via the new modes. A single VDI driver is all that is required, since GEM recognizes new reolutions and takes advantage of them on the fly.

Hence the success of Falcon graphics modes, screen blaster, etc.

>There's a whole lot more beyond the statement of "it can be done" to think
>about.

Not really. The 1040ST that you use as an example is pretty much a plug and play solution, complete with graphical installation programs. The process of upgrading the 1040's graphics would take all of 10 minutes, from start to finish. Tech support from STeve's (incidentally, not too far from where the school was located) is excellent, far superior to most clone companies'. Of course, "she" probably wouldn't need it.

Look at ART's (Acorn Risc Technologies) web pages:

http://www.art.acorn.co.uk

IIRC, but if not then there is a link from Acorns pages at:

http://www.acorn.co.uk

There are photographs of a processor card with a StrongARM and
pictures of it running in an Acorn Risc PC.

This is far from vaporware!

>
>Someone made the stupid assumption that no one would ever need more than 4 Megs
>of memory.

The original IBM PC was in fact limited to 640K (or rather 1Meg) because
of hardware. The cpu that that machine ran on was only capable of addressing
that much.

Subsequent systems addressed the issue, on both platforms.

```
>
>However... in the case of the Atari ST, the limitation is a HARDWARE limitation.
>That is, you can't use more than 4 Megs of memory EVER, unless you hack into
>the guts of the machine and modify the hardware.
>
>The IBM design was limited by the OS, and new OS's have elimintated that
>problem.  Thus you can have "flat memory" extending from 0000 to gigabytes
>of RAM.

     And it only took Microsoft 14 years to accomplish this feat (for
     the masses anyways).

>
>Next time you hear an ST owner gloating about the 640K DOS limit, hand them
>an 8 Meg SIMM and ask them how they plan to use it..

     The ST owner won't NEED that 8Meg SIMM to begin with. Any Microsoft user
     will. An OS that eats up 400K vs one that eats up 4Megs...

     The 4Meg barrier on the ST, although present, is much less of a problem.

'Fat' Mac. (Well, maybe some people called it the Big Mac, but that wasn't the accepted term for it. :-)

: Wasn't the apple named "Mackintosh", whilst the computer is "Macintosh".

Something like that. Supposedly another company was already using the apple's name, so Apple changed it enough to avoid legal trouble. Do you HONESTLY think "McDonalds" is a more likely root for "Macintosh" than "Mackintosh"? :-) <bonk>

: I have generally found that Apples "Be nice to the user" and "hide system
: details from everyone" seems to slow both me and the machine down whenever
: I use a Mac. I guess that means that I am just not a Mac person.

Perhaps. One of the main principles of the Mac's design was that as many of the technical details as possible SHOULD be hidden from the user. For most users, that's good design. A truly technically oriented user can still learn a lot about the system and hack it up almost beyond recognition, although it'll probably never be as hacker friendly as Unix. :-)

"I was practically naked, dressed as a dominatrix and was slapping the audience with this huge rubber dick I was carrying. (Bill Gates) wandered by, so I started screaming 'Serve Me! Serve Me!' and put the dick on his shoulder--at which point, he emitted a mouse-like squeal and ran away. It was quite a scene." Slymenstra (GWAR)

THorsten you have a point. However, when a "computer illiterate" teacher needs to have her PC system configured, it isn't hard for her to find somebody nearby who DOES KNOW how to do it for her. When she has questions about getting on the internet with an Atari, she has to have a newspaper article (or whatever) printed about her. If she had an existing PC system rather than the Atari equipment to begin with, there never would have been an article (or this ongoing argument) because she'd have been on the net already and it wouldn't have been a situation worthy of print; it would have been "mission accomplished" rather than despair in the limelight.

: resource for intelligent discussion. The Boetians win
: again and intelligent discussion retreats to moderated
: mailing lists.

Such a reactionary. :-) If you want calm intelligent discussion, use the other groups, comp.sys.*.hardware, etc. *.advocacy groups are inherently antagonistic, as they draw out the most fanatical and confrontational members of the various communities.

"I was practically naked, dressed as a dominatrix and was slapping the audience with this huge rubber dick I was carrying. (Bill Gates) wandered by, so I started screaming 'Serve Me! Serve Me!' and put the dick on his shoulder--at which point, he emitted a mouse-like squeal and ran away. It was quite a scene." Slymenstra (GWAR)

True. But advocacy groups can be fun!

I haven't heard such colourful language used in such a while. Just goes to show what a sheltered life I've led.

(Yes, I do have a life now, and damned expensive it was to acquire one.
It took me years to save up enough to buy one, and the following week they
heavily discounted them. Such is life. Sigh.)

There are some very obvious keywords: web, Netscape, mosaic, ALL, SLIP/PPP

Some of us have been about longer than the web has. Excuse us if we think
that the web is NOT the totality of the net.

The OPTION of using the web was not the way the question/statement was
posed. The approximate verbage was connecting to the internet. This
covers quite a bit of territory: from wyse60's to HP/UX workstations...

Say what..?????

I advocated the use of a PC with a 4 Megabyte memory limitation..?

I advocated the use of a PC with 4 bit color video..(16 colors)..?

I advocated the use of a PC with only 32K of video memory..?

I advocated the use of a PC with 320 x 190 resolution..?

I advocated the use of a PC with low density floppy drives and hard drive partitions limited to <32Megs..?

I advocated the use of a PC with seriously limited serial port speed..?

I advocated the use of a PC with no commercial Internet software development and virtually no retail outlets..?

Wow... you must be smoking some really strong stuff..!

What an imagination...

(Quit spreading lies...)

"JEDI", the individual without a real name, a real address, and thus without any real credibility, writes:

>Your answer hinges on whether or not you think that the whole Internet is
>comprised of the World Wide Web and whether or not you think you need
>Netscape to browse it.

Interesting.. that one statement demonstrates that you have absolutely no grasp of the discussion at hand, and no ability at all to concentrate on a message and extract any meaning from it.

It's not *MY* perception of the Internet that is in question, but the desires of the teacher in the original thread which are under discussion. While we can't know exactly what was in her mind, I seriously doubt that a text-only web browser, or a text-only newsreader was what she was thinking of.

As I've mentioned countless times before, but which you seem to be unable to grasp.

Also, as I've mentioned many times before, Netscape is not the only available solution on other, more viable platforms. I've specifically also mentioned Mosaic... and there are plenty of other easily available and easy to use programs. You don't seem to be able to grasp that thought either.

>Ignoring responses that...

Responses that were impractical from the viewpoint of the teacher in the original article... which you seem to be constantly ignoring.

>Your clone customer standards are about 3 years out of date...

What does that have to do with the discussion at hand..? Try to keep with the program.

>QUIT SPREADING LIES Bobby.

>The ST will do realtime audio and 8 bit colour.

Right... in your dreams. Do pigs fly in your dreams too..?

Like James said.. tell me how the stock 1040STfm systems the teacher in the original article (remember, we're trying to concentrate on one thought here) can do realtime audio from the 'net, and display 8 bit color images in a browser. Talk about lies... sounds like you really don't know that much about Atari computers after all.

>And if she doesn't have a few grand to spare..?

Then she buys a reasonably priced alternative, mainstream computer platform. You seem to have a really skewed view of what's necessary, either monetarially or technically.

The modifications (hardware hacks) necessary to upgrade a 1040STfm to do what even an inexpensive PC or Mac can do would be VERY expensive by comparison, and would still result in an unsupported, obsolete platform. How could the teacher justify spending that kind of money on something like that?

Too bad I'm not in California... I'd contact the Mercury News and call the teacher to find out what she thinks of your "solutions"...

Wah..! The truth hurts...!

>Connecting to the Net she can do. Running Netscape she most probably
>cannot do.

Congratulations, Einstein... I've only said that about six times already.

You're assuming the teacher in the original article has wet dreams about running a text-only browser or newsreader, or wants to become a computer weenie and learn to install CAB/Stik/ANTmail/MiNT/Linux/etc/etc/etc. when she could be up and running a full-fledged Internet application quickly and easily, and with full support facilities, on a more reasonable platform.

It still doesn't matter how many different ways you try to twist it, it still remains that the Atari ST is not a good platform for Internet applications in the original situation in this discussion.

 ^^^^^^^^^^^^^^^^^^^^^^^^^^^^
```

You have to shave that 1.7 factor back off again, since there is no such thing as a "clock doubled" '040. The 33 MHz chip you're talking about is _exactly_ the same thing that some deluded people are now calling 66 MHz.

>P5/60 equalling dx2/80? Crap motherboard/chipset in the P5?

The P5 should be a lot better than that, especially for recompiled code.

>> MF>030/20 is 8 Mips so a 030/32 would be around 10 Mips

The figure I've seen is about 3.5 for a 16MHz '030.

Of course MIPS can mean any number of things, so comparisons are very unlikely to give useful results.

If you count actual instructions executed per second (about the least useful thing to do), a 20MHz '030 would top at 10 MIPS (or 6.5 if there are no 2 cycle instructions, I can't recall at the moment).
Most instructions take much longer than that, though, and then there's memory to worry about.

>> I seem to recollect once hearing (perhaps reading) the 68000 was
>> around 8 MIPS

Maybe if you could mange to run it at 66 MHz or so...

Performance per MegaHerz is a totally irrelevant number.
You can get the 486 at three or four times the clock frequency, you know.

>GM> > You're not wrong by much. In a 'real' world test performed by my TT
>GM> > owning friend, (4meg ST/4meg TT RAM) who compiled POV Ray 2.2 for himself

>GM> > more RAM. That to me says that the 68030/68882 pairing, given 32-bit wide
>GM> > RAM access (TT-ram) is actually faster at a given clock speed than a

Something must've been _very_ wrong with your tests.
A 32MHz '030+'882 should be far behind a 50MHz 486DX at normal floating
point work, not to mention integer.

>GM> > 486DX chip. Imagine how much quicker the 68040 is than a 486DX. 040 is

At non-fp work an '040 is perhaps 50% faster per clock than a 486.
The 486's are available at _much_ higher clock speeds, though.

>GM> > reputed to command thrice the grunt of the 030/882 at the same clock

It could actually be a lot more than three times as fast at fp.

>When I got TT RAM it was matching it. I was also "embarressing" my
>40Mhz 040 Quadra owning friend, it was too much slower (can't remember
>how much slower) but it had him "worried".

That must've been an '040 without an FPU, or your tests were really
completely screwed up.

Oh.....it's one more of those guys who thinks he's the grandfather of the net. Pissed off that it's not an exclusive thing? Sorry bub...even the newbies today will be trying to sound like you in a couple of years because if you think this exposive growth of the net is about to end, you're as dumb as you appear to be. Trying to sit back and pride yourself on being here before someone else is stupid....and doesn't entitle you to a more valid opinion on what constitutes the "totality" of the net. As I said before, can't even go "www.atari.com" without web access. Wish I could ftp or gopher everything, but I can't.

Yeah but quit acting like accessing the web is an unusual request. You even see web sites in television and print ads. Don't act like the general population who sees these web sites isn't expecting to access them.

If you think the quotes I'm talking about are true sentences, you need to refrain from asking me to re-examine my humanity (as if you could somehow convince me anyway) and re-examine 6th grade grammar and try again.

Aaaahh....Brian Rolland-Miller blowing hard again calling others "blowhards" and proclaiming other's topics "moronic." What's new, besides abother bout of hypocricy? Why can't you just ignore the posts; you're blowing quite hard yourself. You're very highly opinionated. Everyone does it. You're not alone. Why don't you just back off and maybe the flames won't get so high this time? What did I do to you? Do you want us both to spend man-years trying to dog each other like that? You know we've done it before but what's the point? Learn not to take ASCII so seriously.....and don't pretend that you're not equally guilty.

[snipped out a bunch of Brian's theatrics]

I think the point is that you can't even look at the latest Jaguar screenshots in any quality on www.atari.com - with an ST because it can't do the resolutions and colors commonly used. Big deal. I'm sure there's some compromising work-around with reduced colors and resolutions. Big deal. I think we should just forget it, and get another computer if you want to see the graphics as intended.

This thread is getting fairly exasperating! Yes, I know i mentioned using my Mega STE with Cab/STik being successful, but having read the news groups, there are a lot of Atari users using 1040's with colour or mono screens, with or without hard drives, using either shell accounts, Cab, oasis, those with more memory using mint, and so on. This indicates that the *original* argument that it was not feasible to use ST's on the net is quite false, no matter what furphies the opponents care to bring up.

As I said in my original post, the main advantage of Netscape is that it opens multiple connections, thus speeding the downloading of graphics. I must admit, on Macs and IBMs that I have used this is definitely a plus, but still slow. For speed, either a shell account or turning off the graphics would be preferable.

Oh, BTW. I *am* a teacher. I work with Atri ST's every day, both with classes for music applications and in our office for WP, DTP and accounts. If we needed to in our department, i would feel more than capably equipped to set up our 1 and 2 meg ST's to connect to the net!!

Sometimes I randomly search threads to see if they have anything I want to read. I thought the person who started this one was a little confused when he proposed settling our differences, so I suggested junking the tedious threads. Then I junked the rest of it.

>I'd say this is exactly what this group and all advocacy groups are about!

That's one reason I thought he was confused. The other was thinking we actually could settle our differences or live in harmony. (Maybe it got better, but I only read the first two paragraphs or so.)

>P.S. you forgot to tangentially mention NeXT! Shame on you!

: In CONFIG.SYS, try   devicehigh=c:\directory\drivername
: In AUTOEXEC.BAT try loadhigh c:\directory\drivername

I would like to add a little more info here.
In order to load high your config.sys must first load
Himem and emm386. This enables you to load drivers between addresses
C800 and E000. You should first check whether any of your hardware
uses any of these addresses, eg. Network cards, sound cards Etc.

Your Config.Sys should therefore start of with somthing like

```
DEVICE=C:\DOS\HIMEM.SYS
DEVICE=C:\DOS\EMM386.EXE /NOEMS
```

If you have hardware devices using the area of memory mentioned above
you should exclude EMM386 from using these addresses. For example
to excluse the area from D000 to D800 add /X=D000-D8000 to the
2nd line. Dont be too woried about this, if you get it wrong, the
worst that is likly to happen would be that your computer would crash
and you would have to boot from a floppy to correct the problem. Usualy
a mistake just means that a piece of hardware doesnt work properly.
Also you can usually make more memory available by adding /I=E000-EFFF.
This area is not used by default, but is available on most machines.

your config.sys should also contain a

```
DOS=UMB
```

it is also a good idea to load dos high by using

```
DOS=HIGH
```

you can combile these lines into one

```
DOS=HIGH,UMB
```

The order in which you load drivers into upper memory can also affect
the amount of memory that you free up.
If you type MEM /C | MORE you can see which drivers are loaded into
upper memory, and then experiment to to get as much into upper memory
as possable.

: This will load drivers, TSRs in upper memory instead of conventional.

: --

: The opinions expressed here are mine and not Intel's.
: If you don't like them, tough!

Or, better yet, buy a real computer - not a PC Groan.

(BTW, why were you (yorgo@ix) asking advice in _advocacy_ groups? The only
[almost] on-topic group is comp.sys.ibm.pc.misc.)

How utterly arrogant and presumptuous.

WE have no basis for determining what her perceptions were. They may
very well have been spoonfed to her by the same news media that has
fed you your own fud. WE dont know what her specific goals are.

At least I acknowledged the fact that how one approaches the problem
affects the possible solution.

One's goals might be attainable through other means. Without exposure to
them, one would never know. The current FUD would prevent such exposure.

Also, Usenet is nothing more than a text stream. Adding a gui to it will
not in and of itself enhance it's utility.

>Like James said.. tell me how the stock 1040STfm systems the teacher in the
>original article (remember, we're trying to concentrate on one thought here)
>can do realtime audio from the 'net, and display 8 bit color images in a

It would seem that you are conceeding my points despite your rhetoric.
Why else would you 'raise the bar' and add constraints that weren't in
Jimmy's original taunt.

RA - desk accessory
images - greyscale preview window w/ the option to spawn a dslide equiv.

>browser. Talk about lies... sounds like you really don't know that much
>about Atari computers after all.

Enough to know what the real constrants of ST greyscale and pallete
flipping are. These details are glaringly absent from your replies.

>
>>And if she doesn't have a few grand to spare..?
>
>Then she buys a reasonably priced alternative, mainstream computer platform.

There aren't any. A clone or Mac that will run a current graphical
browser WILL COST you.

>You seem to have a really skewed view of what's necessary, either monetarially
>or technically.

Windows is bloated and inefficient.
Netscape/Mosaic are bloated and inefficient.

A wintel clone has to be configured accordingly, otherwise the ST's
will be outrunning it (by orders of magnitude).

>
>The modifications (hardware hacks) necessary to upgrade a 1040STfm to do
>what even an inexpensive PC or Mac can do would be VERY expensive by comparison,

>and would still result in an unsupported, obsolete platform. How could the
>teacher justify spending that kind of money on something like that?
>
>Too bad I'm not in California... I'd contact the Mercury News and call the
>teacher to find out what she thinks of your "solutions"...

Why don't you. Long distance rates aren't THAAT bad.

Once again: Usenet is a text stream. Adding a gui to it doesn't enhance
its utility.

Also, a text only browser will not impair one's information gathering abilities.

Those precious dragonfly pictures of yours are just as accessable with Lynx or CAB.

>weenie and learn to install CAB/Stik/ANTmail/MiNT/Linux/etc/etc/etc. when
>she could be up and running a full-fledged Internet application quickly
>and easily, and with full support facilities, on a more reasonable platform.

Both platforms have the same aquistion method.
Both platforms have the same installation routine.
Both platforms have the same interface.
Both platforms have the same support interface.
Both platforms have 'full-fledged' network access.

>
>It still doesn't matter how many different ways you try to twist it, it still
>remains that the Atari ST is not a good platform for Internet applications in
>the original situation in this discussion.

The original situation included people that already had significant Atari hardware resources. Replacing those resources would cost more money than the time involved in having those who already have Atari experience setting up CAB.

>
>I advocated the use of a PC with a 4 Megabyte memory limitation..?

Total addressable space isn't so much important as how much of
it will be gobbled up by the OS or the app.

You don't have the option of more RAM on a PC, you have the
necessity of it.

>
>I advocated the use of a PC with 4 bit color video..(16 colors)..?

Well, unless you have the extra money for a new card, most likely
you did.

Wake up Rip, this one hasn't been a problem for YEARS.

>
>I advocated the use of a PC with seriously limited serial port speed..?

Well, this one is right on the mark actually, if you don't know what
UARTS you have.

Also, 14.4 is not 'seriously limited'. Furthermore, the problem is in
software & not the MFP.

>
>I advocated the use of a PC with no commercial Internet software development
>and virtually no retail outlets..?

Very little Internet software development is 'commercial'.

And as far as the 386 goes: it is as much an orphan these days as the ST.
Everyone is developing for much bigger PC's.

>
>Wow... you must be smoking some really strong stuff..!
>
>What an imagination...

Nope, I just have happened to run Netscape on the sort of machine you
described.

>
>(Quit spreading lies...)

A 386 will run Netscape about as well as an ST will.

Nope, just being pedantic.

The Internet is a transmission medium. Usenet, the Web, ListServs, Veronica
Gopher, et all are overlayed on top of that. One can be on the net proper,
even have an IP address, and still not be touching the web. Not using the
web does not automatically make one's net connection useless.

THAT is one of the attitudes being objected to.

>newbies today will be trying to sound like you in a couple of years
>because if you think this exposive growth of the net is about to end,

Yet another raising of the bar...

You really should set your parameters in the beginning and then stick to
them, instead of changing them every time you are showed up.

If you've got the money, by all means get another computer. Some of us
need/would like to spend it elsewhere. (like purchasing said Jag)

Quite a productive use of educational time, to be sure, too.
Yep, a stock ST cannot do hi-res 256 color graphics.  But add a
graphics card, and it is quite capable of doing so. . . all for less
than a new computer.
-
Of course, getting a new computer is the best option.  If one wanted
the best and easiest to use machine for internet access, the teacher could
purchase a Macintosh bank, easily networked using Appletalk.  A t-1
leased line and Netscape 2.0 using MacTCP would complete the setup,
and would certainly be the most capable of the easy to use setups now
out there.  However, it would also cost several hundred thousand dollars.
The added utility of being able to view pretty pictures in all 256
colors is most likely not worth the additional expense.  And if one
was willing to add features to the machines to get these pictures,
```

s/he could purchase a graphics card and get decent video (even on a stock
1040 STfm).
-
It's a revolutionary business concept called matching added value to
added cost. If the latter exceeds the former, the investment is a poor
decision. Things would be a lot different in West Chester and Sunnyvale
if two computer companies' executives had adhered to this standard.

Lots of schools are making the investment to hook up into the internet. Many have their own web servers.

You have no idea what schools are using the WEB for. Its not for viewing just pretty pictures. The web is full of resources that instills interactivity and higher order learning. I developed a lesson plan on the Normandy invasion with the help of the WEB. I printed out maps and diagrams of the German defenses in occupied France.

On Thu, 18 Apr 1996 whome@eatme.com emailed me from an unknown host:
> 320x200 16 colors 8mhx pleasurable???? GET REAL. remember most people didnt go
> out and buy a Falcon, most people already jumped ship before then.So most STer
> ar stuck with the old 8mhz. What is pleasurable in this. Most PC video cards

Most people didn't buy a Falcon because few stores stocked it, there was little advertising, and it was underpowered and overpriced for the functions it was intended to do. Those are all Atari's "cheapest you can get it" approach to creating/selling hardware.

8 Mhz isn't pleasurable for me (that is why I upgraded), however the plethora of accelerator cards for it shows just how good the design was. How many accelerators can you get for your PC?

> dont even go down below 640x480 and 256 colors at a minumum because they all
> see lower as a TOTAL JOKE. I have mor memory in my video car , 8 megs , than
> most sters in their systems.   Its almost the 21st century and you are on

And how much of that 8 Mbytes in your video is used? As a single screen you would be able to have (at 256 colours) a screen larger than most current monitors can display. 640x480x256 only uses 300k (307200 bytes) for one contiguous image. Going to 24-bit colour ups this to 900k (921600), or even 32-bit (which is really 24-bit colour with an extraneous byte added to speed up [ha!] processing), this will only go to 1200k (1228800). So where is the other 6984k of video ram used?

That smacks of "more money than common sense", or the PC-worlds "my stats are better than your stats" childish phallus comparisons.

> technology that really hasnt changed since first conceived in 1979-80

1979 was the conception date of the Atari 8-bit.

THE ST was conceived in 1985. It owed nothing to the 8-bit, as it was a "fresh from day one" design.

I own a TT, conceived around 1990. I am rarely in a screen mode lower than 640*480*16. My physical RAM is not limited to the 640k of "conventional" RAM, and 8 or 16 Mbytes of Extended. I have 4Megs of 16-bit RAM, and 16 Mbytes of 32-bit RAM - both of which are expandable (in my case to 10 and 128 Mbytes respectively).

The PC architecture was conceived around 1980, (for the September 1981 release of IBM's original "home computer" PC). Little has changed since then - video is still card based, rather than using (possibly separate) motherboard ram.

PCers rarely use lower because they have been brainwashed that lesser colours are (ugh!) primitive, nasty and (sometimes) not even available.

Most just plug-in and go with whatever setup the machine was in when shipped to them, and remain blissfully ignorant of anything else the hardware is capable of.

Lesser colours onscreen will give faster video performance, smaller video RAM requirements, and cheaper video hardware.

Few users _need_ 256 or more colours.

Graphic artists, photo-retouchers, and other colour-intensive occupations are about the only areas where high colour counts are required.

The most common use of computers is for word processing. This is one area where large numbers of colours are a waste of time and money.

If you are wordprocessing, how many colours do you need? Black and white for the "page" and text upon it, perhaps red for typographical marks (errors, for example), perhaps blue for page layouts (margins, page breaks), and maybe one more colour for highlights or some other WP feature. That is five colours in total. Where would you suggest the other 251 (of the 256 available) colours be used?

A PC as a home computer (read "games box") is overkill. Why spend thousands on an obsolete-before-you-buy-it PC when, for one tenth the price, you can buy a console?

>however the plethora of accelerator cards for it...

A handful of very expensive hardware hacks is a "plethora" of "accelerator cards"..? I think not... a "plethora" is "the state of being too full, an overabundance, excess"...

Hardly the state of anything relating to the Atari ST.

>How many accelerators can you get for your PC?

How many would you like..?   Let's see... there's the Evergreen 586 processor upgrade with the Cyrix 586 chip to upgrade '486 systems, the Evergreen DX4 upgrade for '486SX or DX systems to 100Mhz speed ($99), and the Evergreen upgrades for '386 systems to '486 chips. Then there's the CPU MAXmizer upgrades in 75, 100, 120 and 133 Mhz speeds to take a '486 system to Pentium power, and the 100 Mhz '486 MAXimizer to upgrade slower '486 systems to 100Mhz speed (that's $129). Also available is the CPU MAXimizer 686-100 and 120 to upgrade Pentiums. There's the Make-It 586 upgrade to replace a '486 chip with a Pentium class processor at up to 133 Mhz ($179-$219), and the Make-It DX4 upgrade for 286, 386 or 486 machines (give your 286 machine a 486 processor for $99). Not to mention the Intel Overdrive "accelerators", and all the others...

>...little has changed since then - video is still card based rather than
>using (possibly separate) motherboard ram.

"Still" card based..? Of course it is.. for the extreme flexibility that easily changed cards afford. You want a different video capability than was built into your ST's motherboard..? Hack and slash time.. solder, cut and hack.

You'll notice the TT and VMEbus Atari machines are "card based" for video flexibility too.

>PCers rarely use lower because they have been brainwashed that lesser colours are (ugh!) primitive, nasty and (sometimes) not even available.

Or perhaps they don't want to use 16 color mode (like the best the ST can do) because it is plain butt ugly compared to 256 color modes. You see, they're not stuck with 16 or 4 colors, and they can tell which looks better.. also they're not forced into rationalizing that "16 colors isn't alll that bad, really it isn't".

>Most just plug-in and go with whatever setup the machine was in when shipped to them, and remain blissfully ignorant of anything else the hardware is capable of.

Right. I guess that explains the zillion-dollar-a-year business in addon cards.. and all the catalogs and retail stores full of replacement addon cards. Most don't buy them, so that explains why there are so many available.

>Lesser colours onscreen will give faster video performance, smaller video RAM requirements, and cheaper video hardware.

Very true. I guess that means an 8-bit Atari 800 is FAR better than an ST because it has fewer colors available and far smaller video RAM requirements. It's cheaper too. And a Timex-Sinclair only has 2 colors max available, so it must be even better.

>The most common use of computers is for wordprocessing.

Actually I've read that entertainment and multimedia are the leading "application" on home computers of the type we've been discussing.

256 colors are essential for that kind of software.

>A PC as a home computer (read "games box") is overkill. Why spend thousands on an obsolete-before-you-buy-it PC when, for one tenth the price, you can buy a console.

Why spend thousands indeed..? When nicely games-capable computers are available for far less than $1000.

Also, "console" games will never measure up to the quality and complexity of computer based games. You'll NEVER see games like X-Wing and Tie Fighter on a console. There just isn't enough RAM or mass (writable) storage.

You'll never have a game as versatile as computer-based DOOM either, because of the same requirements.

Consoles are good for quickie "shootemup" and "beatemup" style games, but for anything with very much substance, you need more resources than consoles can provide for that "one tenth the price".

OK.. here's the deal.

The Atari ST was a great computer in its day. It died a horrible death at the hands of the people who ran the company and I'm really pissed about that.

The ST was my all-time favorite computer, just slightly edging out my Atari 8-bit computers (very slightly).

But comparing it to a currently produced system and trying to rationalize its limitations into strengths is futile.

Faster is better, more colors is better, larger mass-storage is better, stereo multi-voice sound is better, versatile expandability is better, and on and on.

If Atari had kept up developing the hardware, then maybe we'd have a competitive system today, but they didn't, and we don't.

We have a nice memory of a really great computer.

You should lay off the funny smokes, Jabba... quote me back something "misinformed" if you can...

Stuff you may not like perhaps, and stuff you don't seem to be able to understand, true. "Misinformed"..? Not likely.

The question to Lonny was intended to draw him out about his supposed wonder-ST system. Since he can't answer the question, but has instead resorted to diversion, we can assume he was lying. Since you too have resorted to mis-direction on the same question, we can only assume you too don't have very much "information" on Atari computers available either.

Just a lot of FUD.

>Well if Bobby's involved, so is misinformation.

Too bad, JABBA... bet you can't quote any...

>You haven't the slightest clue as to what a bogus hostname implies...

Sure.. it implies someone with no credibility.

You could be Peter Sinclair-Day... in fact, you probably are.

>You also appear to be excessively superficial.

You, JABBA, appear to be excessively clueless and juvenile.

So blame the application? So I want to digitize 44.1 kHz 16-bit stereo. I want to manipulate 1280x1024 in truecolor. Is total addressable space important now? As an aside - can't the 68000 address 16 meg? Why does the Atari have that limit - I mean WHY?? Aren't there Mac and Amiga (back when they used 68000 also) with huge memories?

>   necessity of it.
> >

Well, I have 16 megs now. Do I want 24 or 32 megs? No, I'll OPT not since it's not NECESSARY. Heh heh. Joking, of course....PCs are memory hogs but good thing a meg of ram costs much less (and consumes SOOOOOOO much less power) than 10 years ago. If Atari computers were still made today, betcha most people would have 8 and power users would want 16. Look at how the 520ST's 512K became woefully inadequate. I'm sure there were people screaming that 4MB was a ridiculous amount of RAM back when 512K was fab. Before that there may have been 128K users screaming that 512K was a waste. Before that it was 64K, 48K, 32K, 16K....etc... I accept it as fact that PCs are hogs, but it's not like the trend of ever-increasing memory requirements should come as a shock to any of us. I'm sure there's a guy running CP/M on a 4 mHz Z80 with 16K thinking the rest of the world is a bunch of fools.....which brings us to Atari users who (with imposed 4MB limit) scoff at modern PCs.

> >I advocated the use of a PC with 4 bit color video..(16 colors)..?

But there's no video CARD on the computer he's talking about.

> >
> >I advocated the use of a PC with no commercial Internet software development
> >and virtually no retail outlets..?
>   Very little Internet software development is 'commercial'.

I've been formatting and using AOL, Compuserve, Delphi, (etc.) disks for years, glad for the free disks in the mail. However, its pretty commercial when all of it offers Net access and it's falling out of my mailbox for free, with other junk mail. Should I ever become self-abusing enough to try it, the option is there.

>
>   And as far as the 386 goes: it is as much an orphan these days as the ST.
>   Everyone is developing for much bigger PC's.
>
>

Yeah but I can still find every peripheral you can think of for a 386. I

```
can still run a lot of new software on a 386.  So it runs slower.  So
what?  How long does it take a 386/33 to balance my meager checkbook?
The only thing I can't do is play the latest games because they're
hardware hogs.  However, it's a far cry from being an orphaned ST user
who can't find _any_ software or peripherals in retail outlets.  Hell,
you can't even find low density 3.5" disks much anymore.

> >Wow...  you must be smoking some really strong stuff..!
> >

>      Nope, I just have happened to run Netscape on the sort of machine you
>      described.

Were you using a 1200 baud modem?  Admittedly I know little of Netscape
but is it really a processor hog?  Seems like any computer with a
57K-baud fixed line would work fine.

>
> >
> >(Quit spreading lies...)
>
>       A 386 will run Netscape about as well as an ST will.
>
>

Ok....I'll find a 386/40 with 256K cache and 8 megs of RAM and netscape,
and you find an ST running NETSCAPE and we'll try 'em out.  Your mission
this weekend:  write netscape for the ST.

James

Yeah, but what if my new CD-ROM drivers are on a web site? Seems like
ftp sites and gopher is dying. What about all that stuff that simply
AIN'T OFFERED except on the web? Adding a gui woudn't enhance its
utility if I could somehow access the web from my VT100 terminal, but I
can't.

All kindsa arguements made here. However, I think it would be
frustrating to spend hundreds of dollars on modems and phone lines and
not be able to access the fastest growing part of the net. Might be
smarter just to ignore the net as a whole until it's time to upgrade.

On 19 Apr 1996, Gaven Miller wrote:

> 8 Mhz isn't pleasurable for me (that is why I upgraded), however the plethora of accelerator cards for it shows just how good the design was. How many accelerators can you get for your PC?

If memory serves, the video hardware took turns with the rest of the system (talking ST here) for access to the RAM. I've always wondered how they sped this up without an amazing number of wait states, and amazing cache, or both.

Accelerators for PC? Well......

(1) 286 can get a 386SX (like Kingston's "386/now")
(2) 386SX can get a clock-multiplied 486slc
(3) 386DX can get a Cyrix 486DRU (or whatever)
(4) 486: Most SX/DX motherboards either have "overdrive" processor slots, or can have the CPU moved and jumpers changed. Either way, can go up to DX4/100 (does AMD make a DX4/133?) or the Pentium overdrive (I always want to call this kludge the Pentium SX).
(5) Pentium? I don't know of any accelerators, but 4 out of 5 ain't bad, you did ask, and Pentiums are so much faster than a 520ST that they're "already accelerated" it could be argued (grin).

>
> > dont even go down below 640x480 and 256 colors at a minumum because they all see lower as a TOTAL JOKE. I have mor memory in my video car , 8 megs , than most sters in their systems.   Its almost the 21st century and you are on
>
> And how much of that 8 Mbytes in your video is used? As a single screen you would be able to have (at 256 colours) a screen larger than most current monitors can display. 640x480x256 only uses 300k (307200 bytes) for one contiguous image. Going to 24-bit colour ups this to 900k (921600), or even 32-bit (which is really 24-bit colour with an extraneous byte added to speed up [ha!] processing), this will only go to 1200k (1228800). So where is the other 6984k of video ram used?

How much does 1600 x 1280 in true-color need? Heh...never seen more than 4 myself. Never had nor needed more than one myself.

>
> That smacks of "more money than common sense", or the PC-worlds "my stats are better than your stats" childish phallus comparisons.
>

Goodness sakes, such a graphic choice of words! Heh heh. Such comparisons are everywhere, in every commodity, not just PCs. (Not that I'm defending it, mind you)

> > technology that really hasnt changed since first conceived in 1979-80
>
> 1979 was the conception date of the Atari 8-bit.
>

Actually, 1979 was the release year. The 400/800 was conceived in 1978.

> THE ST was conceived in 1985. It owed nothing to the 8-bit, as it was a "fresh from day one" design.
>

No, the ST was a good machine in its day, but typically slapped-together in a Tramiel corner-cutting move. Too bad the Amiga wasn't an Atari product, because with the ST's OS it would have been an Atari user's wet dream. I always felt like the 520ST was sort of a next-gen Commodore 64....from the guy who brought you the Commodore 64. Corner cutting like only 3-voice sound. I guess it owed its sound capabilities to the 8-bit Commodore because although totally different sound chips, similar capabilities. By definition of what ATARI was prior to the ST, the ST was an alien design and only Atari because of the name stamped and stickered on it.

> I own a TT, conceived around 1990. I am rarely in a screen mode lower than 640*480*16. My physical RAM is not limited to the 640k of "conventional" RAM, and 8 or 16 Mbytes of Extended. I have 4Megs of 16-bit RAM, and 16 Mbytes of 32-bit RAM - both of which are expandable (in my case to 10 and 128 Mbytes respectively).
>

You have two totally separate RAMs - ST RAM and TT RAM. Such an eloquent way to do things, eh? Such duplication. Since there's all that ST RAM in there, why didn't they just throw in a $12 68000 and you could have stuck on another keyboard and screen and used both types of RAM at the same time....heh heh.

> The PC architecture was conceived around 1980, (for the September 1981 release of IBM's original "home computer" PC). Little has changed since then - video is still card based, rather than using (possibly separate) motherboard ram.

IBM's home computer was the PCjr, the dismal flop that came LATER and totally separate from the original conception of the PC. Yeah, video is card based, so it can be tailored to individual needs and doesn't have to fight the CPU to access system RAM.

>
> PCers rarely use lower because they have been brainwashed that lesser
> colours are (ugh!) primitive, nasty and (sometimes) not even available.

Actually, because lesser colors look like sh*t and remind me of the days when I had no choice but 16 or 4 colors. The real world has more than 16 colors and so does my PC screen. You gotta problem with that? (grin)

>
> Most just plug-in and go with whatever setup the machine was in when
> shipped to them, and remain blissfully ignorant of anything else the
> hardware is capable of.
>

Hey - whatever works for 'em. Who says you have to judge them? Many people drive their sedan to work totally stock. Others probably lower it and put on 50-series tires and black windows, foxtail on the antenna, speakers the size of what the steering wheel USED to be and a steering wheel the size of what the speakers USED to be....maybe put on some hydraulics and some fringe hanging in the window to match that velvet glued on the dash! The driver of such a vehicle might look over at the guy who drives the same car stock but still makes it to work on time, and naively think that the guy is "blissfully ignorant" because he doesn't realize his car is capable of becoming a rolling ghetto.

For lots of people, the PC is like a can opener or table saw: They turn it on, use it, and turn it off. When you're using your power drill, do you contemplate what it is capable of? If the holes you're drilling are satisfactory, do you perplex yourself thinking that you don't have, should have, or do have the best power drill on the market? Personally, I drill with the sucker and then throw it back in the box.....kind of like my PC. Are you suggesting that it is used improperly, and what is your basis for such?

> Lesser colours onscreen will give faster video performance, smaller video
> RAM requirements, and cheaper video hardware.
>

You sound like the proponents of the original Macintosh. HEY, THAT'S IT...LET'S ALL BRING BACK MONOCHROME!!! Can't get any less colors than that! No thanks. As imperfect as my P5/PCI computer is, it makes beautiful graphics that no sour grapes can detract from.

> Few users _need_ 256 or more colours.
>

Few people _need_ a remote control for their television set, but it sure is nice.

>
> The most common use of computers is for word processing. This is one area
> where large numbers of colours are a waste of time and money.

Yeah but it's fun to play Descent II or Mech Warrior between pages....but
you wouldn't know these games since they're not available on your platform.

>
> A PC as a home computer (read "games box") is overkill. Why spend
> thousands on an obsolete-before-you-buy-it PC when, for one tenth the
> price, you can buy a console?

I use both! I'm probably more of a Nintendo man than PC. I relish many
NES and Super NES games that aren't available on other consoles or
platforms. Yet I play some "nexgen" type games on my PC. What's wrong
with that? Who says you can't enjoy it all?

Boy, have I got news for you.... Most modern video cards are fastest in
256 colour SVGA modes. 16 colour modes arebanked modes, and thus inherently
slow for quite a few operations.

>And a Timex-Sinclair only has 2 colors max available, so
>it must be even better.

Now _that_ goes without questioning, I presume?

    One doesn't fully appreciate the elegance of the ST and it's underlying
    microprocessor family until one is faced with the impossiblity of accessing
    that vast array of free memory you have because your software is depending
    upon one particular (and miniscule) portion of it.

    Although, the original segmented memory model of the 8088 was archaic
    and just plain unnecessary even when compared to it's contemporaries.

Dear Mr. Markus Wenzel,
You should be responsible for your actions and also be prepared to back
them up with tangible facts. As for a fact, while we're at it, tell me
when did you put in a new tape drive in your dear NT and did not have to
reboot for the syestem to reckognize it. You should visit comp.os.aix
newsgroups and check out what those people are talking about. You need a
new driver? No worries matey, just chuff it in, dynamically, that's why
the PowerPC/AIX3000 is regarded as the BEST combo for a gateway with ISP's
(with deep pockets, of course)

                   I really think you should be ashamed when
                                you are prepared to make such remarks as
                                "NT is closer to UNIX than AIX"
What are you administering anyway? Novell I presume...

A nice bit of selective perception.

I posted a nice detailed tutorial on how to install lynx on a unix shell
account using any generic terminal.

That trumps anything you've posted by orders of magnitude.

STOP spreading LIES.

>Where does this teacher go to buy CAB/Stik/ANTmail..? Babbages..? Egghead..?

We were talking "Internet access", right? If there is no IP at that school
and the teacher hasn't Internet access at home, how would he be able to
teach his pupils about Internet?

And with internet access, finding www130.zip is not that hard.

>Who does the teacher call when she has problems installing the programs..?
>The local "Atari dealer"..?   Is there an 800 number to call for CAB problems?

There are newsgroups. These are accessible via Internet.

>How does having a UseNet newsgroup or an e-mail address in Germany for support
>help someone who can't get the applications to work to get ON the Internet..?

How does one who is not on the Internet teach his pupils about it? He has
to learn it himself first.

>Remember, we're not talking about someone who is already experienced with Atari systems and having to support themselves, or who can compile their own programs, or install Linux for fun... and we're not talking about someone who has all the time in the world to play with an unfamiliar operating system

Finding a Linux expert is very hard these days ... NOT!
Installing a Linux system is equally hard ... NOT!

What is somewhat complicated is maintaing a Linux box, but remember that it has some advantages, as it

- may serve as firewall for the classroom/school
- may serve as proxy cache system
- may serve as NNTP-server
- may serve as ftp-server
- may serve as IRC-server

etc.

Plus the teacher has some control about what the pupils do on their subordinate machines.

>Many of the responses to the original thread claimed that all the "Internet" hype was just glitz an unnecessary glitter, and that a text-only browser like Lynx is "just as good".

lynx is good - and fast.

>I don't think a text-only browser is what that teacher had in mind.
>
>Watch a TV show like C-NET Central, and you'll see what the teacher probably wants to do.

Wait - he wants his pupils to click around through the web?

[problems with STiK]

There still is an alternative, as I said before, any ST is also capable of emulating a VT100, and a terminal program is _very_ easy to install. Sure, it's text only, but it _is_ the Internet, and this solution is cheap.

That's 'cos there's nothing to document with Edit! (I presume you mean
Notepad) I could write a clone of it before lunch (2 or 3 hours by my
watch) without even working hard - yes, I've got a good toolkit... :^)

Unix editors with lots of documentation tend to have lots of features
(including things that M$ would never think to put in a text editor)

Obviously, you've failed to link with libclue.a

Donal.

I have for sale a ATARI 520ST+ computer
(HOLLAND)

With:
- 2.5Mb of memory
- 28Mhz speedup card built in
- hardware 386-DOS card
- 3.5" en 5.25" diskdrives
- harddisk 105MB
- HD and powersupply built in transparent case
- clock built in

- B/W and color monitors
- printer
- mous & joysticks
- books (Dutch)
- lots and lots of software (Prof. and games, more than you can imagine!!!)

everything in good shape, and working properly.

The computer will be sold for any reasonable offer..

If you are interested mail me!!!

I have for sale a ATARI 520ST+ computer
(HOLLAND)

With:
- 2.5Mb of memory
- 28Mhz speedup card built in
- hardware 386-DOS card
- 3.5" en 5.25" diskdrives
- harddisk 105MB
- HD and powersupply built in transparent case
- clock built in
- B/W and color monitors
- printer
- mous & joysticks
- books (Dutch)
- lots and lots of software (Prof. and games, more than you can imagine!!!)

everything in good shape, and working properly.

The computer will be sold for any reasonable offer..

If you are interested mail me!!!

Did someone say it was impossible?  I must've missed that one.  I don't
find it intimidating, but some of the flamers might...

>>just a matter of someone writing the software.  Looks like someone did...
>
>    Yeah, Atari, in 1985. It's been on the ST language disk for 10 years.

Actually I was talking about the web-browsing and stuff.  I'm sure it's
been able to make the connection, but the ST browser is a fairly new
development, correct?  At least, I didn't see one a couple of years ago,
which was the last time I was able to use my ST for a while...I thought
the guy who wrote RatSoft was working on one, but I could be wrong...

Not irrelevant to everyone...remember, not everyone has as much tech
experience as yourself.  Different levels of competence on all platforms.

Open letter to a advocates of their pet OS's

*** Please note that this article has a large header that poster may ***
*** wish to edit. This is not a spam. It is a posting intended for ***
*** interested parties. ***

You know, there has to come a time, in every discussion, where someone says "Look, we're just never going to agree on this and it has taken up hours and hours of our time. So why don't we all just take stock of everything that's been said, make a decision and stick with it." Some might say that advocacy wars are fun. On behalf of the vast majority of people angaged in this leviathan circular whirlpool of discussion, I have to disagree. Look at how wound up we all get. Look at the number of capital letters. Look at all the highly personal and offensive insults that have been slung. Do you really think that this is fun?

So, lets say that you use a computer and you like the OS. Do you like it or do you have to use it? If you have to use it, then is that because there is some killer application on it that doesn't run on anything else? Let's face it, this is the nub of the issue so why don't we all take some advice? If you use a Mac or a Next Station or a PC and you just like it, then take a look around at what your freinds have. Have a go on their machines and see what they can do. You'll probably stick with what you have, but you will have a better appreciation of what's on the go. Certainly, you will stop making error-ridden diatribes against the machines in advocacy newsgroups.

Let's say you are in the killer application situation. It's daft for you to switch to another platform, or you can't do your work. BUT! If you feel that you have had a bit of a bum steer forced on you, do not try to hotly defend the machine if you think it is flawed. If you are a user who has a huge investement in say, Macintosh hardware and software, then it is silly for you to change platforms unless you have the funds to replace all of your software. The same goes for the users of all the other machines.

The crux of the issue comes with new users who understand very little about computers and about the choice available. It is certain that if they go into a PC store, they will be shown an IBM compatible machine. These users should ask to see the other types (Macs, Amigas, Ataris) etc. and make a real choice for themselves. Each individual has different needs and should buy the system with the software that most suits them.

So when it comes to advocacy, we are all right. Most of our machines really are the best machines for us because we know how they work and it would be expensive and time-consuming to change. What we should really be arguing about is how best to get NeXT Stations, UNIX boxes, PCs, Macs, Amigas, Ataris and Acorns to talk to one another.

On the other hand, if you think that the advocacy war is fun, then go ahead. Perhaps we need a new group called comp.sys.any.advocacy.futile.

Regards,

Nigel.

>Now tell me how much cheaper a Macintosh card with above specs does cost,
>much less than 900 US$s?

I guess I'll assume that 1.399 DM equals about $900US.. still sounds pretty high to me.

And... who cares about Macintosh anyway..?

I don't have Macs, don't know about Macs, and don't care about Macs.

I know about (and care about) Atari and IBM computers, and $900 for a video card is awfully pricy.

>A nice bit of selective perception.

Spoken by the master of selective perception.

I quote:
>The most dominant thread in this group for weeks has been anti-atari fud
>spread by cloners and the debunking thereof.

What an fanciful perception of the previous discussion. Awfully paranoid sounding too. It's amazing how you can go from discussing whether a teacher can use an ST effectively for "connecting to the Internet" to "anti-atari fud spread by cloners".

I don't recall any "debunking" taking place either.

We know now that VT-100s can be connected to Pentiums used as a server, and that a 68020 with an FPU can run Linux, and that 16Mhz STes can run CAB/Stik, but we still don't know how that teacher can use her Atari computer to do what she wants to do.

>8 years on the net, 3 years on the web.

Ah.. that explains it... you're a clueless newbie.

I just saw someone asking how much a 24-bit video card costs for whatever Atari we're talking about and I wanted to know the price. You go off with this "Why should we bother answering charges of the likes of you....." and accuse me of knowing "NOTHING" about the subject...and accuse me of "misinforming" others???   Heh heh. Well "Jedi", you need to start using the force.... I saw BobR ask a question - "How much is a 24-bit video question" - and I don't see the question answered. I am curious myself. Clearly, the question has not been answered. This is merely a question. It has nothing to do with "knowing about" whatever YOU think it does, and it has nothing to do with misinformation. Also, the message came from "JEDI@.MISSING-HOST-NAME" and not from "some of us;" I point this out to you not because it makes any difference to me whatsoever, but someone needs to point out the obvious to you.

James

PS- I thought the Star Wars movies were cool, but "JEDI@.MISSING-HOST-NAME" makes you look like a 14-year old masquerading behind his daddy's net account pretending to be an action figure. News for ya: a true Jedi has wisdom.

. . . and then failed to provide any logical and/or accurate reasons why
this is.

>That's similar to a lot of the responses about the teacher.. "If you have
>a 68020 with FPU, you can run LINUX"...   well, I seriously doubt the
>teacher has a 68020 with an FPU, OR a 16mhz MegaSTe with ANY video card.

But this has no bearing on the original discussion, which is primariily about whether these machines could be easily and effectively connected to the Internet. They can, as evidenced by my explanation of the WWW130 package.

>If anything, the teacher probably has a bunch of 1 Meg 1040STfm systems
>with color monitors.

Again, perfectly capable of hooking up to the Internet.

>What "Internet applications" will run on those systems and be as easy to
>install and maintain as a more "mainstream" platform and application..?

WWW130, which includes the Install program you seem to find so vital, the details of which I posted to this group (which were the catalyst that ended your argument).

>Where does this teacher go to buy CAB/Stik/ANTmail..? Babbages..? Egghead..?

She doesn't "buy" them. S/He can order them through the mail from a PD service, or call an online service and get them, or call their ISP and get them (believe it or not, most ISPs I've dealt with have provisions for TOS, in the form of NOS, and soon, I expect, in the form of STiK.) Oasis II will be available shortly.
BTW, a trip to Babbages or Egghead, or any other computer games software house will primarily yield a recommendation of OS/2 Warp. Talk about unsupported applications. . .

>Who does the teacher call when she has problems installing the programs..?
>The local "Atari dealer"..?   Is there an 800 number to call for CAB problems?

1. The programs are very well documented, and explained. Installation is flawlessly easy.

-

2. If any problems are encountered, help is an e-mail message (or phone call) away. Most confusion will be over Internet terminology, which can easily be answered by the ISP.

-

3. If the teacher has problems with a DOS box, or Mac, where does s/he turn? Many internet applications refuse to run under Windows 95. The best advice I've gotten from the authors are "get Win 3.1." Most systems don'ty ship with Win 3.1. Can't buy it at Babbage's, either.

-

4. There seems to be a myth that support for problems on the PC is readily available, and free. Not so, otherwise, consultants like myself

wouldn't be able to make much of a living. :')

>How does having a UseNet newsgroup or an e-mail address in Germany for support
>help someone who can't get the applications to work to get ON the Internet..?

If, in the event that the software absolutely doesn't work, s/he cannot get online, the ISP will provide technical support. Again, the tricky part isn't copying the disk, or installing the modem, it's making sure that the information about your provider and his account is accurate. Once this problem is resolved, 99.999% of all problems disappear.

-

Most ISP's these days send a flyer with relevant information covering the basic technical information procedures. And the tech support at your local ISP will be fully able to overcome any problems you encounter, since at a base level, the technology used on all computers (TCP/IP) is the same.

>Remember, we're not talking about someone who is already experienced with
>Atari systems and having to support themselves, or who can compile their
>own programs, or install Linux for fun... and we're not talking about

Of course not. We're talking about someone using WWW130 to install STiK, CAB, Antmail, and MGFTP on a TOS machine. Not that difficult, really.

>Sorry, but that sounds like a real case of sour grapes. Because a bare bones
>ST won't do the real-time video and audio, or even display an 8bit color
>picture, all of that becomes "unnecessary glitter"...

If the school has the budget for the T-1 leased line for real-time video and audio via the web, they most assuredly can purchase the necessary Sun Workstations and pay the consultancy team the necessary funds to install the system. Your argument flies out the window, yet again.

In reality, very little audio/video gets sent out over the net. It's primarily pictures and text links. For this, the ST is adaquate (and the primary issue is whether or not the STs should be scrapped for PCs). If you are once again attempting to argue against the Falcon (modern TOS machines) being used in place of PCs, your argument again flies into oblivion, since the F030 base is fully capable of all of the above. You're fallacious on both counts.

>Watch a TV show like C-NET Central, and you'll see what the teacher probably
>wants to do.

If the teacher wants to do that, s/he must first get the $1 million in funding and full-time consultancy team. Chances are, the real application of Internet isn't flashy graphics and text, it's getting the information out and in a usable form in an educational context. This is why Apple IIs, the VAX, and other text-based systems are still in use.

>Now, hand a new user.. someone who has NEVER played with KA9Q or Stik or MiNT a copy of WWW130 and watch them install and configure it. Someone like the teacher in the original article.

For that matter, hand the user a copy of Windows 3.11, Winsock, and Netscape 2.0 and watch them install it. They'll have a happier and easier time using WWW130. Simply copy the disk to your destination disk, double-click on "install.prg", have your ISP's tech information in front of you, and type in whether it uses dynamic IP addressing, and your server address when prompted to (with fully-automated help along the way). I'd assume that the average computer teacher has the technical knowledge to slog through such "horrible technical specifications."

>who are having problems with CAB/Stik/ANTmail, and ask yourself what a complete novice like the teacher is going to do.

Red herring. . . slog through the comp.sys newsgroups where people are having trouble using Winsock, and ask the same question.

-

Besides, legions of users aren't going to post "What's wrong? CAB works PERFECTLY." The only posts are going to be from the fraction of users who have difficulty. Again, these problems are primarily linked to having the improper information about your ISP in the browser install category. A call and working with an ISP will resolve it in 15 minutes.

>There are probably dozens of people around her who could help her with Mosaic or Netscape... how many experienced Atari ST users do you think are in her school who could help her..?

Here, you demonstrate a complete lack of knowledge about how the WWW works. The VAST amount of problems are not in the browser itself (like Netscape, Mosaic, or CAB), but in the TCP/IP stack (STiK, WinSock, and Lizard, to name a few). No amount of knowledge about Mosaic or Netscape will help you if your problem is in TCP/IP (where most any technical problem would be).

>Back to my point...   YES, the Atari ST CAN "connect to the Internet", BUT for most people "the Internet" is an inappropriate application for an ST.

You have yet to make a valid point in defense of this statement not easily refuted by fact/reality.

>The teacher would be better served by using the Atari computers to run educational programs and obtaining a different platform for Internet connectivity.

Spending more money in the process than buying hard drives, 24-bit graphics cards, and TOS-relevant consultants to service the current systems.

There goes your cost argument, and hence, your entire argument.

VisCORP, a company of former Amiga engineers and developers who want to revive the Amiga as a viable platform, and who want to make set-top boxes based around Amiga technology. Of course, many argue that the former will only provide funds to shift to the latter (in implementation, that is).

I seriously doubt anyone WANTS to restrict themselves from the web. Sounds like more sour grapes. Hell, can't even go "www.atari.com" without that abilty. Whether or not "you think the whole Internet is comprised of the World Wide Web" or not, it does exist and and why would anyone NOT at least want the OPTION to use it?

>

If she doesn't have a few grand to spend, she can get a used 386SX system
(bare minumum to run 3.1 in enhanced mode), a $50 internal modem and run
Netscape and do everything imaginable on the net/web.

No it doesn't.

James is not the one claiming to own a 24bit Atari card.

You (Lonny) ARE.

He's not the one I asked about the cost.

You (Lonny) ARE.

Why should James have to know how much your video card was..?

Why should I have to know how much your video card was..?

Seems funny that you have this much problem with a simple question.

BobR

<chuckle> Why YES! Usenet *.advocacy groups are the long standing place for intelligent, rational, and polite discussion. :-)

For the people that can't spot sarcasm if a liberal taxed them to read it, that's obviously not true. *.advocacy groups are second only to political groups when it comes to flaming, ranting, and screaming knock-down drag out debate. That's what it is, that's what it's always been, that's what it will probably always be. Think of it as a text based bar room brawl for geeks.

: I believe that I am hardly alone in this understanding.

Unless somebody has put AOL out of our misery, probably not. :-)

: >are should not read them. (Instead of trying to convert everyone else to

Then why are you writing this?

I'd say this is exactly what this group and all advocacy groups are about!

P.S. you forgot to tangentially mention NeXT! Shame on you!

: am hardly alone in this understanding.

I'm not so sure I agree with this 'understanding'. To clear matters up, I shall quote from my big, blue Webster's dictionary (unabridged, second edition-deluxe color!).

"ad'vo ca cy, n. 1. the act of pleading for or supporting; an
advocating (of something). 2.advowson."

Advocacy groups are therefore a place where people can plead or support thier particular platform... not necessarily in an inteligent mannor. Exactly what's been happening. ;)

Have fun!

Yeah. Why try to gently correct people or instruct them
in how newsgroups were intended to be used or point
out to the bickering masses that they're wasting time
in pointless self-flagellation or ....

Much better to simply walk away. Abandon usenet as a
resource for intelligent discussion. The Boetians win
again and intelligent discussion retreats to moderated
mailing lists.

Cheers,

Andy

You're both wrong. The OmegaTech 4056716-25242XLESDG Mark II with
SuperBlastertron sound and MegaBlitter graphics is the best machine in
the universe! It's even appropriate for the Internet! :')

Less than the purchase price of a new PC Clown, er, Clone. And it will deliver stunningly crisp graphics.

>I don't have Macs, don't know about Macs, and don't care about Macs.

. . . or TOS machines, for that matter.
Of course, Macs aren't appropriate for the Internet, either, right? And since you don't care about them, they're completely irrelevant to the discussion, despite the fact that they'd probably be the best machines to buy for school Internet access if "buy new" was an option.

>I know about (and care about) Atari and IBM computers, and $900 for a video
>card is awfully pricy.

Against $1500 and a lot of frustration for a Windows box, most teachers would opt for the easy-to-use TOS machine. PCs are simply inappropriate for a serious educational environment. &:'>

Depends on the group and when you read it. You are right- the groups *are* whatever we make of them. Mr. Eastmond was simply stating that we should make them a place where name-calling, the inevitable racial/religious/sexual-orientation bashing, and all of the other stupid crap become the exception, rather than the norm. You know, there are .flame and other established groups for this sort of lashing out.

I bet! ;-)

Now, back to my regularly-scheduled search for intelligent advocacy. It does exist- I've seen it. Sometimes, it even over-powers irrational, unitelligent, and inappropriate discussion...

I find it more than amusing that instead of debating the facts with me,
you and historic blowhard James Woods have chosen to debate this moronic
topic.

Probably because your argument was never steeped in reality, and was disproven by simple fact.

Ah, the frustrations of being factually correct, they take the fun out of debating. . . Perhaps what this newsgroup needs is a virtual Peter Sinclair-Day (but pro-Atari to the point of vomiting) to debate these people. Then, we can simply sit back and watch the sparks fly.

```
BobR:  "The Atari is inappropriate for the Internet, clueless newbie."
-
Rational person:  "Explain WWW130 with point and click installation."
-
BobR:  "URK!  Well, your video card is more expensive.  This PROVES
        that the TOS platform can't do Internet.  What about real-time
        sound and video?"
-
Rational person:  "Uh, Bob, no machine hooked up to the web at 28.8 K
                   baud can do RTS or RTV.  You need a dedicated T-1
                   line, which runs at about $10,000 per month."
-
BobR:  "Well, they can get that, but they can't afford to hire a
        consultant.  Besides,  $900 for a video card stinks!"
-
Rational person:  "Uh, Bob, for the standard Internet linkup, using
                   SLIP or PPP, Use of Oasis and/or STiK/CAB is
                   just as capable as Winsock/Netscape."
-
BobR:   <silence>
-
Another TOS User:  "Good video cards are available for $900."
-
BobR + James Woods:  "900?!?!!?  This proves the inferiority of TOS.
                      They are useless for serious work!!!!"
```

And so the cycle continues. . . <sigh>

Well.... O.K.!  You got me on that one.  :-)

>mannor.  Exactly what's been happening.  ;)

Um, no, it isn't, which is one of Mr. Eastmond's points (unfortunately
not the first, but the one that he prompted him to write, I think).
Pleading, advocating, and supporting doesn't include vicious
name-calling, racial slurs, etc., etc.  I think you must agree with
that.  Thanks for posting the exact definition!

You really didn't need to post to so many newsgroups, now did you?

Anyway, on to your question. I am going to have to make some assumptions
here because you haven't given us a whole lot of information.

Assumptions:

MS-DOS
Posssibly Windows
You don't want to change settings in a dynamic manner

Suggestion:

Use Microsofts MEMMAKER, it's really quite good!

In CONFIG.SYS, try   devicehigh=c:\directory\drivername
In AUTOEXEC.BAT try loadhigh c:\directory\drivername

This will load drivers, TSRs in upper memory instead of conventional.

>fud spread by cloners".

1) Negative statements were made about Atari's
2) Positive statements were made about clones
3) Positive statements weren't made about Macs despite them
being as well suited for the task as contemporary clones

It might be a stretch (but not a long one) to consider you a cloner.

>
>I don't recall any "debunking" taking place either.

More selective perception, or lack thereof. Ref: my make tutorial.

>
>We know now that VT-100s can be connected to Pentiums used as a server, and

Connecting to the Net she can do. Running Netscape she most probably cannot
do. However, connecting to the net != Running Netscape.

>
>>8 years on the net, 3 years on the web.

Ah, yeah, right, whatever...

The whole thread wouldn't quite be so pathetic were it not for the fact
that the alternate PC platform you first advocated would suffer from the
same constraints as ST's.

There is more to the online universe than just the Web or the net. You
don't appear to be aware of that either.

Jedi's are fictional characters.

The meaning of 'Jedi', within this culture, is not limited to the works
of Lucas and derivatives.

I would listen to any 'kid' who could fake a hostname over the likes of
you anyday. (especially on this subject)

You haven't the slightest clue as to what a bogus hostname implies anyways.

You also appear to be excessively superficial.

Not too pricey. The price comparisons used to be a lot worse. However,
the card in question would set a clone user back ~$500. This is still
quite a premium for a VME adapter but, the atarian would probably not
be able to get as responsive a system for the extra 400.

BTW... Lynx does not require building. It is distributed as an executable (linux included).

Just unzip and run...

However, as I suspected, it does't support the subsequent html standards too well.

No bobby this doesn't mean pictures. In fact, it does your pics just fine. It's those other bits of html (those that you never brought up) that might make lynx problematic: no support for forms and frames. Although I think most people don't setup their pages well enough to deal with frames anyways.

The dragonfly pictures came down just fine.
NO problem using lycos or webcrawler...
The web savvy atari advocates might find the first hit
under lycos:dragonfly insect a bit humorous...

And of course there is doslynx for bobby's beloved donated
386 pc clones... '-)

If you want free stuff like A home Page, A case Of Topps NBA cards, A case of Nabisco cookies, A tetra 3 gallon fish bowl kit, A tetra 2 1/2 gallon fish bowl kit, a Gatorade gymbag, a gatorade towl, a gatorade hat, Some power ranger videos, 20 0.5 ounce packs of chiclits or An atari Jaguar and games then go to http://www.kidscom.com
When you are there click on the register button. At the part of the registration where it says to type in the name of the person who sent you there type Chase Ward. At the part where it says to type the email address of the person who sent you there type ac684@sfn.saskatoon.sk.ca
Once you are registered you can begin to collect kidkash points. When you have enough points you can get a free atari jaguar or some other stuff. It is super easy to collect points all you have to do is go there once a week. You can get extra points by playing the online games they have there. EVERYTHING ABOUT THIS IS FREE. This is mostly for people younger than 14 but if you are an adult then you can go to. They have a special

place for adults. You still get the free stuff. THERE IS NEVER ANY OBLIGATION. YOU DON'T EVEN HAVE TO GO BACK TO THE PAGE EVER IF YOU DON'T WANT TO.

Yes, from an accounting point of view..Buyers market for now..
>
> When Atari took write-downs for inventory, that translated to bigger

What does this have to do with Apple? IBM and Digital took heavy writedowns before. Both doing fine..

Saids who? Apple sold the original Mac Plant back in '89'. In '85' their
Texas and Garden Grove Plant was sold. Afterwards bounced back. Their
recently sold Colorado Plant will still produce Macs for at least the next
three years. The company that bought it makes hardware for HP and other high
tech firms. May end up being the main Mac clone plant.

Your logic equating Atari/Tramiel with Apple escapes me. Following your logic,
Mercedes Benz is a gonner for losing $4 billion last year..

If anything: it might be close to a good VMS.

Ruthless attacks? I was reading these threads for a couple of weeks before posting and I am only defending what I consider to be a still viable platform. I read the "Atari" groups because I _use_ only Atari computers. The ruthless messages and inacurate information is coming form the ones who are not using the Atari computers in the first place.

I don't waste my time reading news groups devoted to other platforms. I simply don't have the time or the interest. Honest. Turn the tables and put yourself in my shoes and let's see if you can sit still and not get involved. Granted I've made the decision to stick with what I have, but that doesn't mean I have to sit an listen to such nonsense. So the PC finally pushed all the other platforms aside, that doesn't make it good, but it does make it easy for you PC users to find fault with everyone else.

I never said the PC sucked, I never said the Atari was the best, I only pointed out the obvious, or at least what I thought was the obvious.

Perhaps the PC has a place in the market or whatever, you will however _not_
find a PC on my desk.

B&C Computervisions had 2600 Jr's new in the box when I was there last
week--don't remember the exact price, but it was <= $40.  Their number is
(408)986-9960.

Interesting post, I'm not sure if you're more ignorant about NT, Unix
or AIX. Feel free to come back and give us another opinion when you've
used more than one of them.

Must be an 'off brand' harddisk manufacturer. Figures....I doubt you'd see any large, successful, well-known hard disk company (Seagate, Maxtor, Conner etc.) dealing with the TRAMIELS!!!!!!

Yeah.....why ask you? If you knew anything about the "Atari" either, you'd
have answered the question.

I guess that'll have to do me for awhile, but your enthusiasm is lacking a bit... :) What's the ST browser called? Will it run on a Mega 2? I've been absent from the world of Atari for a while and am a bit behind, sorry.

>>Not most of what I find at the big bookstores around here... And the net
>   And what bookstores are around there? So that I or someone may verify
>   the validity of your statements.

The usual... Bookstar, Walden's, Borders, Barnes & Noble, plus the major computer stores. Now, if someone wants to go through all the trouble to visit each and every one of these in the Phoenix area, take inventory of all they carry, and make a comprehensive comparison of them all, they're welcome to do so. I just comment on what I see.

>   Personally, I think you're FUDing...

Think what you wish, but I'm sorry you're so paranoid. I have much better things to do than FUD this newsgroup. (Unfortunately, it sounds like others like it.)

```

What a load of nonsense: I'd been glad to hear from a Linux user that actually ran the machine for a year continuously without having to reboot. Windows 95 is remarkably stable, by the way, I leave it on all the time (admittedly with reboots about once a week.)

>
> Linux is well documented. Better than any other OS out there. Look around in
> sites like www.linux.org to get an idea of the kind of documentation that
> there is.

Ha! The reason that so much has been written for Linux is that most trivial tasks are far more complicated than they have to be. People don't need 10 pages of instructions for Edit on Windows, but even that is not enough for vi.

>
> Linux conforms to standards. It's compatible with all Unix programs, and

The "standards" that Linux is conforming to is a patch work of bugs and workarounds that has plagued UNIX users of all breeds for eons. A clean, proprietory, and properly licensed scheme like NT has its advantages.

```

But calling people "weenies" and gloating so much...that was kinda silly.
I never doubted the ST could connect to the net, I always figured it was
just a matter of someone writing the software. Looks like someone did...

>>If you're talking about Windows, you're right...unnecessary complexity
>>(compared to everything else). But software that's more complex USUALLY
>>can do more sophisticated things. A skimpy little 35-page manual won't do
>>for QuarkXPress, for example...
>
>   Should have shipped with the product. If it didn't that's really telling.

True... Unfortunately, these big-program manuals don't always go as
in-depth as the users want. That's why we see these big books full of
other techniques, shortcuts, design tips, etc. The Photoshop Bible, for
example, is great. And, unlike a lot of these other books, it's written
with a sense of humor...

>>There's a lot of those, but everybody thinks they can put out a better
>>book. And if there's a market for it, why not?
>
>   This does not address the original issue.

It doesn't? The original question was why there are so many books for all these programs if the Mac and Pee Cee are so easy to use. So many people are competing to write the best books with the best (and most comprehensible) info. Thus, a flood of books to wade through. :)

> The AT Clones have a lot going against them. They always have.

I agree...my PC friends always scoffed at my ST, but when I actually showed it to them they pretty much shut up. The clone graphics have improved since then, but to me it comes across as the same ol' blocky stuff.

Cab, it comes as part of the www130 package - plug 'n' play now.

>Will it run on a Mega 2?

Yes. You need a SLIP connection currently (being worked on) unless you have Mint which will already let it run under PPP.

>I've been absent from the world of Atari for a while and am a bit
>behind, sorry.

It also runs on the TT and Falcon, in just about any rez.

there have been several such reports. i've seen people posting about
what did and didn't happen when their jiffy counters turned around -
which, on an intel box, happens after just over 497 days of uptime.

>Windows 95 is remarkably stable, by the way, I leave it on all the
>time (admittedly with reboots about once a week.)

good for you. me, i couldn't care less.

>Ha! The reason that so much has been written for Linux is that most
>trivial tasks are far more complicated than they have to be. People
>don't need 10 pages of instructions for Edit on Windows, but even
>that is not enough for vi.

that's because Edit doesn't do jack shit. thing with unices is, all
these software toold that you complain about needing documentation
for, they actually have functionality that needs to be documented.

>The "standards" that Linux is conforming to is a patch work of bugs and
>workarounds that has plagued UNIX users of all breeds for eons.

as opposed to the patchwork of idiocies, backward compatibilities and
bugs that is MSWin, i take it. at least the Unix standards are
documented.

> A clean,
>proprietory, and properly licensed scheme like NT has its advantages.

the very fact that you try to _brag_ about something being
proprietary makes me wonder why i even bother following up to you.

Hi,

System 7.5 will take up about 2.5mb, and if you have any autofolder or accessories under MagicC you could end up with quite abit less than 4mb available. Check the memory configuration under MagiC to see what it has allowed. You get to set up mode by holding down the option (or mabey it is the shift key) while you start MagiC.

Mike

    UNIX sysadmins perhaps... or even developers.

    But to users...

    ...unix itself is the same (especially if you use the same shell) on
    a Sun Sparc, an HP, a MicroVax 3000, an Atari Falcon, a PC clone,
    an AIX station or even a cray YMP.

    NT cant quite claim that yet.

That was the reply I expected. <== See how easy that is?   Neat eh??

First of all you are the one doing the "my puter is better than your puter".
My original post that mentioned my 24-bit video card was to simply
show that Atari's these days have more than 320x200 in 16 shades of gray.
You can read into that whatever you want, apparently you already have.
Perhaps you have jumped into the middle of a conversation or simply like to

argue. I don't know? I don't care. I don't have to answer to you or anyone
else so if you want current prices call your nearest Atari dealer.
I seriously doubt your gonna buy a vidoe card for the ST you claim to have
after spewing out all those specs and dollar values on your PC.

Your postings are typical of has been Atari users trying to justify their
platform jumping.

Hold it guys, Escom have agreed to sell Amiga Technologies to US Viscorp, at
a profit, and will hopefully no longer be dealing with them.

As for this comment below, can it be true, Escom selling off the Amiga and
selling the Jag and ST's instead ;) (couldn't resist that).

Wayne

Jag II, come out.

Unfortunately no one defined what "hooking an ST up to the internet" actually MEANS...

A dumb terminal, text-only, slow modem connection is no sweat.. sure, an ST can do that.

Is that what 99% of the world means by "hooking up to the Internet"...?

I don't think so.

Why is it that most of the people in this thread seem to know little about the relevant subject?? I use Cab/STik/Antmail for browsing, mail and IRC, and Oasis for mail and news, and having used 486's and Macs at work for the same job, the only advantage of Netscape is that multiple connections load the graphics a bit faster.

I'm using a 16mhz MegaSTE with a Matrix card, giving me the same graphics capabilities as the PC's, except I crash less!!, particularly with the latest versions of the software. Mind you, my machine only needs 4 meg of ram, and all the programs concerned can fit on less than *two* HD floppies!

It must work OK, I spend 1-5hrs per day using it! And before anyone brings up the card, it was a recent investment. I was getting the same sort of usage in hires monochrome before. Not quite as pretty, but eminently functional, and easy on the eyes!!

BTW.,installation of these progs is now virtually Plug and Play!!

:
: What a load of nonsense: I'd been glad to hear from a Linux user that actually

: ran the machine for a year continuously without having to reboot.

There is a huge number of them out there. Last time that subject came up
in one of the linux groups, 496 days was the best someone could offer, and
they had to reboot after that because they had to physically move the
machine.

: > Linux is well documented. Better than any other OS out there. Look around in
: > sites like www.linux.org to get an idea of the kind of documentation that
: > there is.
:
: Ha! The reason that so much has been written for Linux is that most trivial
tasks
: are far more complicated than they have to be. People don't need 10 pages of
: instructions for Edit on Windows, but even that is not enough for vi.

So use joe, or asEdit, or XEmacs, or Crisp or whatever you prefer over
vi. Nobody has to use vi.

And, to put it nicely: The average Win95 user gets a single sheet of paper
which says "look at the online manual", and a lot of garbage on the
harddisk, and they call that "documentation".

: > Linux conforms to standards. It's compatible with all Unix programs, and
: > even supports DOS partitions cleanly, integrating them with it's own.
: > (Unfortunately, MS thinks that it can create it's own "new", "accepted"
: > standards on a whim.)
:
: The "standards" that Linux is conforming to is a patch work of bugs and
: workarounds that has plagued UNIX users of all breeds for eons. A clean,
: proprietory, and properly licensed scheme like NT has its advantages.

It's not a "preexisting standard", however. And linux has exactly that:
Linux/FT has recently been officially POSIX certified, so if you get
that distribution, you know that it will exactly follow the POSIX spec.
Is there even any real spec that details what behaviour of NT is
standardized and what behaviour just happens to be like it is in this
version and might change any day now?

So who the hell died and made YOU the God of the Internet, to sit in judgement of "the validity" of ANYONE's statements..?

All I've heard from YOU are mindless *opinions*, backed up by very little in the way of fact...   so how do WE "verify the validity" of YOUR statements?

Let's hear it.. what are YOUR credentials for judging anyone else..?

Or are YOU just "talking out your ass"...?

>Why is it that most of the people in this thread seem to know little
>about the relevant subject?

OK.. here's the "relevant subject"...

The ORIGINAL article starting this whole thread quoted a newspaper article with a picture of a TEACHER sitting in the middle of a classroom with an Atari monitor on her lap, decrying the fact that she had a room full of Atari computers and couldn't "connect to the Internet" with them.

The original poster asked if that was true or not.

MY response is that while YES you can "connect to the Internet" with an Atari, the Atari computer is NOT well suited for the application, especially in a normal classroom environment.

>I'm using a 16mhz MegaSTE with a Matrix card...

That's similar to a lot of the responses about the teacher.. "If you have a 68020 with FPU, you can run LINUX"...   well, I seriously doubt the teacher has a 68020 with an FPU, OR a 16mhz MegaSTe with ANY video card.

If anything, the teacher probably has a bunch of 1 Meg 1040STfm systems with color monitors.

What "Internet applications" will run on those systems and be as easy to install and maintain as a more "mainstream" platform and application..?

Where does this teacher go to buy CAB/Stik/ANTmail..? Babbages..? Egghead..?

Who does the teacher call when she has problems installing the programs..? The local "Atari dealer"..?   Is there an 800 number to call for CAB problems?

How does having a UseNet newsgroup or an e-mail address in Germany for support help someone who can't get the applications to work to get ON the Internet..?

Remember, we're not talking about someone who is already experienced with Atari systems and having to support themselves, or who can compile their own programs, or install Linux for fun... and we're not talking about someone who has all the time in the world to play with an unfamiliar operating system or track down missing pieces of a user-supported program.

Next, what are this person's expectations..?

Many of the responses to the original thread claimed that all the "Internet" hype was just glitz an unnecessary glitter, and that a text-only browser like Lynx is "just as good".

Sorry, but that sounds like a real case of sour grapes. Because a bare bones ST won't do the real-time video and audio, or even display an 8bit color picture, all of that becomes "unnecessary glitter"...

I don't think a text-only browser is what that teacher had in mind.

Watch a TV show like C-NET Central, and you'll see what the teacher probably wants to do.

Tell her how to do THAT with her 1040STfm.

Now, hand a new user.. someone who has NEVER played with KA9Q or Stik or MiNT a copy of WWW130 and watch them install and configure it. Someone like the teacher in the original article.

Take a look at the comp.sys.atari newsgroups or the large info services like CompuServe to see all the much more experienced Atari and Internet users who are having problems with CAB/Stik/ANTmail, and ask yourself what a complete novice like the teacher is going to do.

Ask yourself who the teacher is going to turn to for help.

There are probably dozens of people around her who could help her with Mosaic or Netscape... how many experienced Atari ST users do you think are in her school who could help her..?

Back to my point...   YES, the Atari ST CAN "connect to the Internet", BUT
for most people "the Internet" is an inappropriate application for an ST.

The teacher would be better served by using the Atari computers to run
educational programs and obtaining a different platform for Internet
connectivity.

The "relevant subject"...

The SuperNova currently costs 1.399,- DMs. This includes a mach64 powered
4 meg VRAM card (by ATI), an interface for the VME bus and driver
software.

Now tell me how much cheaper a Macintosh card with above specs does cost,
much less than 900 US$s?

>before. Both doing fine..

This just isn't about writedowns, Peter. This is about consumer perception and market trends. It's about the future of the industry. It's about learning to adjust in a rapidly changing market. All of which Apple is having problems grappling with now.

>> More shades of Atari's past, Peter. Atari sold off assets to cover
>> losses and write-downs, if the trend continues for Apple, they will
>> go into the same downward spiral that Atari went into.

>Saids who? Apple sold the original Mac Plant back in '89'. In '85' their
>Texas and Garden Grove Plant was sold. Afterwards bounced back.

Have they ever really bounced back? Or is this just your perception, Peter? Don't look at the $ figures. Look at marketshare and industry trends. This tells a different story.

>Your logic equating Atari/Tramiel with Apple escapes me. Following your logic,
>Mercedes Benz is a gonner for losing $4 billion last year..

More Sinflop ignorance and hypocrisy. What were you talking about when Atari was announcing losses in the past quarters? You kept saying that Atari was a "gonner" because of their losses. This statement should be directed at yourself, simpleton. All we need to do is wait 2 months for you to contradict what you previously ranted about.

>> You DOUBT it!? You DOUBT it!? Where have you been, Peter?! Apple's

BobR,
I might have agreed with your assessment a little while ago but WWW130
really changed my opinions. WWW130 is a working, web browser which is
easy-to-configure (probably easier to setup than Trumpet Winsock). It
includes an installation program which is fairly nice. However, the
script files are not hard to understand. I have not used the broswer
much (I have a 2400 baud modem currently) but it seems very stable.
Antmail looks nice, though I use Oasis for mail.
As far as getting a copy, just grab it off the Internet. This is
the same deal as Netscape, correct? Besides there are many Atari
dealers who could help. Teachers need only have Toad's phone number
for information. I don't have an Egghead, Electronics Boutique or
Software Etc. in my hometown. There are no mac dealers in my hometown
but the high school has all Macs. They mail order *gasp*. My
goodness, Bob, how can they stand it?!
Besides, look back at my statistics about schools and connecting to
the Internet. A majority of people are using VT-100 programs to
use Lynx. Yet, you seem to think that it isn't good enough.
The ST can handle VT-100 quite nicely.

Your answer hinges on whether or not you think that the whole Internet
is comprised of the World Wide Web and whether or not you think you need
Netscape to browse it.

Also important is whether or not your main interest is 'data' or
'information'.

>

>>I'm using a 16mhz MegaSTE with a Matrix card...

telnet,ftp,irc2,archie,finger,ping & lynx

also CAB.

>
>Where does this teacher go to buy CAB/Stik/ANTmail..? Babbages..? Egghead..?

BUY? You don't buy Internet software you rube. That is for cloners.

>
>Who does the teacher call when she has problems installing the programs..?
>The local "Atari dealer"..?   Is there an 800 number to call for CAB problems?

Make that 1-900 number. Your clone customer standards are about 3 years
out of date or more.

And she'd go the same place she would if she had trumpet problems. She
could even get her likely possessed Apple IIe to get there too...

>
>How does having a UseNet newsgroup or an e-mail address in Germany for support

QUIT SPREADING LIES Bobby.

The ST will do realtime audio and 8bit colour.

Realtime video, a clone wont do either: too much bandwidth. Realtime
audio the clone wont do either. It will ftp it and play it later. An
arrangement quite within the ST's capacities.
>picture, all of that becomes "unnecessary glitter"...
>
>I don't think a text-only browser is what that teacher had in mind.

Perhaps if her solutions weren't limited to the obvious ones by the
likes of you, she could effectively use the resources she appears to
be stuck with.

>

Apple wrote down the value of the inventory so it can get rid of it cheapely.
The $500 million write down did not cost Apple that amount to build that
inventory.

>
>>> Also, Moody's downgraded Apple to JUNK bond. And industry analysts

Of course they are growing the inventory. The inventory of the new PowerMacs to

be introduced on April 22 are being stockpiled. I suspect Apple has stopped producing some Performa models. The 6300 has been taken off the price list.

The cash loss will be less than $700 million. It did not cost Apple $500 million to build that inventory. Apple is writing down the value of it..

>
>>And what about the Atari of the 90's? 1995 Atari sales declined to $14

Serious? I have questioned why they ever came out with the 603-75mhz. Apple
should of standarized on the 603e at a higher clock speed for the Performas.
This will be the case this month with the 5400...

Apple is currently building up inventories of the Powermacs set to be
introduced on April 22. The other Powermacs such as the 7200/75/90 are no
more.. Once the supply is gone, no more..

>knowledge necessary to set up an ST.

Why? There would be less to it than setting up a PC. Despite your protestations to the otherwise, an ST setup is a subset of a WinTel box.

They have the same interfaces. Both would have similar looking dialog boxes asking for your DNS. Both have text driven unarcers. Both have terminal programs that can automatically download from bbs's or ftp via a shell account.

In 1985, Atari was where the PC was in 1993. If Atari weren't ahead of it's time (or IBM so far behind), your cries of obsolescence might actually have some merit.

Go back to your 8-bits and leave us 32-bitters alone (yes the ST is a 32bit machine you rube).

PETER SINCLAIR-DAY <sinclap2954@cobra.uni.edu> writes:

>Apple wrote down the value of the inventory so it can get rid of it cheapely.
>The $500 million write down did not cost Apple that amount to build that
>inventory.

Wow, Peter, you should learn some accounting. The GAAP Principle of Conservatism states that inventory should be valued at the cost of production. Thus, a writedown of inventory is a combination of both production cost AND sales cost. Apple _WILL_ lose money when it sells the units, it's simply absorbing some (most) of the loss now. Its revaluing of the inventory reflects its lesser value. Of course, if Apple sells the inventory at a lower price than the per cost value,

additional losses are incurred. In the long and short of it, Apple definately loses money from inventory writedowns. They lose money in the form of selling below cost, they lose it in the form of valuing below cost. The financial effect may not be immediate, but it is there, which is why it is reflected on the income statement. If no losses were incurred, no adjustments would be made.

>Of course they are growing the inventory. The inventory of the new PowerMacs to
>be introduced on April 22 are being stockpiled. I suspect Apple has stopped
>producing some Performa models. The 6300 has been taken off the price list.

However, Apple continues making money-losing models. This means that in addition to writedowns, they take a hefty hit on revalued new units sold below cost. Common sense shows that money is lost when revenue is less than expenses.
-
In short, the loss doesn't translate into immediate cash drain, but the long-term effects will include repayment of supplier credit above and beyond the valued amount (a cash drain), and, if applicable, any other variable and fixed costs accrued above the reassessed value of the inventory. Not good, not good at all.

>>A Linux PC is an obsolete platform?
>
>You don't pay attention very well, Thorsten...

I do, but you sure don't understand.

>Nobody I can recall ever said a PC running Linux is an obsolete platform.

You said, for I suggested using STs as VT100 compatible terminals for a
Linux PC instead of getting a whole classroom full of PCs (which some
schools simply can't afford). Besides STiK or MiNT/MiNTnet, this is the
cheapest solution available, and it's the easiest one.

>But an Atari ST running *anything* is an obsolete platform.

Apparently you and I are using the word "obsolete" with different meanings. I use "obsolete" synonymously for "old and unusable", not for "old and still pretty useful". Mail, News and Web access are possible with an ST, as is word processing, spreadsheets, databases, etc..

>And my point is that forcing teachers to "make do" with obsolete equipment
>of any kind is counter-productive in a classroom.

Using a Unix terminal is counter-productive? Learning the basics of word processing on any software except WinWord is counter-productive? Learning spreadsheet use without getting Excel first is counter-productive? Accessing the Web with any browser but Netscape is counter-productive?

And finally: communication with people on the other side of the globe is counter-productive when it's not done by using AOL, CI$ or Netscape software?

Thorsten

I don't recall MAC's being shipped with 24-bit as standard.
What's a good _highly_ configurable 24-bit card cost for a crapple?

Excuse me, if you don't like it why don't you not read it.

Well, ok fine, so you dumped your Atari for a PC. So why bother reading Atari news groups. Your new fancy puter that boring?

Ya, and the Atari Compendium which contains enough information to write a full fledged app is smaller then most of those PC and MAC books which you people claim to be tutorials and such. Ha ha ha ha... Heh he...

Now I'm laughing too.

If you are trembling you better see a doctor about that. ;)

Major announcement

Bullchip Industrial Technologies & Computer Hardware Corporation, pronounced BITCH is proud to present you the world's first ever and first commercial soon-to-be available NISC-processor (NISC, No Instruction Set Computer).

The N-1 gives an outstanding performance at 287 Volts of 30679 NIPS (No Instructions Per Second). It's design is particular suited for embedded solutions. Current negotiations are with and including Nestor Martin, a major French Heating Appliences manufacturer. The cpu-core can double as thermostatic controller and active heat element. Several Nuclear Reactor Power Plants, troughout Europe and Vulcano exploration companies have shown considerable intrest in our technology. And we hope to contract the NASA and ESA, space exploration organisations for use of our NISC-cpu's in their future rocket engine designs.

Availability will be after April 1st of 1997, when we can overcome the current restrictions of cooling this device. As the clamps needed to seat the pasive cooling fans are melting because of the heat involved. We are investigating desings from Rolls Royce and Saab Avionics to use jet propulsion engines as active coolings. We feel that the energy needed for cooling is insignificant compared to the energy used (14 Giga Watt) to drive the MultiMegaScallar 10 layerd 2'000'000 Micron designed N-1 NISC chip.

For software engineers BITCH Corp. has designed it's in-house NISC OS, called NOPE (No Operational Programming Environment) to fluently solve major programming restrictions found in all current cpu designs. With a minimal development time and energy even Home users can create entire programmes to drive space ships, nuclear power plants, industrial washing machines or microwave ovens.

Whether you drive it at 1Hz or 3Ghz (peak), we'll promise you this cpu is HOT.

More Info Call BITCH Corp. (telno. not yet available)
Or write to P.O. Box 1, Opium Town, Nirvana

Oh, how I enjoy reading terrible, dismal, future projections of life in the IT community 12 to 36 months into the future. It just gives me a chuckle while I work deep in the chasms of an IT department of a fortune 100 company....

How long is it going to take for you to realize that the world is moving toward this concept of "Open Systems"? How long is it going to take for all of you to realize that only OS's that are relatively::

- Stable
- Well Documented
- Tight in Conformance with Pre-Existing Industry Standards

will ever have a chance of survival in the corporate world? Let's take a look at these three issues.

Conformity with Standards
Being well versed in the technical support arena for networking the family of Microsoft products, I can tell you from experience that Microsoft did not fully conform with several key concepts in the construction of their IP protocol. (See Info World Magazine, Front Page, April 1 edition). By "enhancing" their WinSock interface, and failing to document their "enhancements", they have created a programming problem that is not soon to be unraveled. This has resulted in several applications (10 according to the article) released by other software manufacturers that fail in Windows networking environments. Also, Microsoft's implementation of the Domain Naming Service for Windows (Microsoft named it WINS (Windows Internet Naming Service)) is another example of a feature of the Microsoft IP protocol that does not conform to existing RFC's in the market place - this makes the WINS feature a proprietary standard, and hence a danger to use in a true IP based environment.

About the Unix World: In my opinion, the reason why UNIX will continue to falter in terms of market dominance is because there are so many different flavors of it in circulation. I believe that UNIX will never realize its full potential until someone releases ONE variant that will "set in stone" certain core functions and capabilities for the OS. As it is today, there's SCO UNIX, HP UNIX, IBM's own flavor of the stuff, and then there are the "freebies": Linux and the like. Don't take me wrong - I realize that UNIX has many strengths, but the ability to modify the core operating system itself is not one of them.

The point: when spending large amounts of money to build an OS, conform to industry standards. This will insure acceptance of the OS into existing networking environments. And in this day and age with corporate networks only growing in response to this imagined need for internet connectivity, conformance with standards, especially networking, will become a core requirement.

Stability
Any new products released on the market, whether hardware or software, in my opinion should undergo a much more rigorous testing program than current products undergo today. For example: many of these Computer Manufacturers today think that since all their new machines now have Flash BIOS support, they don't have to worry so much about allowing bugs to creep out in their BIOS releases. This is totally wrong!!

Any and every bug that creeps out can make the difference of life and death for their products - especially since the Corporate entities today are starting to test products prior to purchase! You would not believe the horror stories I could tell about how some major manufacturers' machine, loaded well and priced right, went down in flames simply because they had an "acknowledged" bug in their BIOS that would be corrected in the next release. Geez - and the reps when visiting during the tests couldn't understand why was a concern to the corporate entity when the problem would be resolved in a "couple of weeks". To the corporate entity, Time is Money - and those couple of weeks would hurt the company's productivity if they purchase that "defective" product.

The point: before sending a product to market, take the time to test it and make sure its bug free. When word gets out that the product is reliable, demand for the product will soar. Bottom Line: STABLE PRODUCTS ARE GOOD. Oh - by the way - this example doesn't just apply to hardware faults - but to software faults as well.

Documentation
Finally: documentation. I don't think I have to expound on this since if you are reading this note, you are fully aware that an OS, and building Apps for it are worthless unless properly documented.

Beating up on Microsoft is silly, and futile. The industry has long cried out for a single OS standard - I can remember people crying for a single OS as early as '83. It might have taken Microsoft 9 years to get there, but NT (NOT 95) is Bill's answer to the call. It's smashing the daylights out of OS/2, Novell, and Banyan Systems - and now, since the Federal Government has declared it an "Open System", and since NT meets C2 level security requirements, its' proliferation in the industry is only going to increase. I personally think that people that get started ASAP and learn the environment and how to service it will be employable for the next six to ten years. Those that continue to throw rocks and geer at it will be the true losers. It may not be the best product in the world, but given time to mature, NT is going to be the next OS standard - both at the desktop, and at the server.

GM> 486 DX2/66 is 44 MIPS

??? According to the figures I have sitting here in front of me "INTEL DX2-66Mhz POWER METER V1.81 MIPS 20.8 MIPS", the closest figure I can find to your 44 MIPS is the AMD DX4-100+ at 39.0 MIPS, these are specs are from a motherboard manual trying to sell this mother board interesting ??

GM> 040/66 ("DX2") is 49 MIPS
GM>
GM> Pentium 60 is supposedly 100MIPS

I would doubt that as in my experence a Pentium 60 is about the same speed as a DX2-80 around 23.3 MIPS (perhaps slower), note this is how it appeares using a machine running 8 Mb ram (both machines) not based on actual tests, but the usability of this is what we in the real world are more interested in (I hope) not figures made up by some manufacturer to claim their processor is greater that the competitions.

GM> So, the 386/030 comparison is more valid.
GM> Likewise 040/486 is a more valid comparison.

MF>Hmm....figures I have rate a 486DX/50 at 22 Mips
MF>486DX2/66 is 26 Mips

Is that for a 486DX-50 or DX2-50 ? if DX2 then my figures rate that processor at 15.9 MIPS for an Intel

MF>030/20 is 8 Mips so a 030/32 would be around 10 Mips
MF>040/33 is 26 Mips

I seem to recollect once hearing (perhaps reading) the 68000 was around 8 MIPS

Marcus could perhaps confirm, I think its in the processor manual, if you still have your copy maybe you could look it up, if not I can tell you were to find my copy :-)

MF>A 040 is nearly twice a 486DX @ the same clock rate
MF>A PPC (not sure which model, but a 32bit job) is more then 90%
MF>faster than a Pentium @ the same clock rate.

MF>You and I both know that Motorola have always been ahead of intel
MF>:-)

Tell me about it, and the processors dont have have as much trouble
just a shame the major manufactures computers using their processors
are usless at marketing and/or removing the stigma of being a games
machine. Interesting point to note what are most clones (80x86 based
) machines used for now, I would like to conjecture games would be the
answer :-)

MF>I ported the Unix version of POV to my TT, and it was very close to
MF>the DX2 50 (Sorry Chris) at rendering the same image at the same
MF>size When I got TT RAM it was matching it. I was also
MF>"embarressing" my 40Mhz 040 Quadra owning friend, it was too much
MF>slower (can't remember how much slower) but it had him "worried".

Marcus I am about to lay my hands on a copy of C perhaps we should
compile it on my DX4-100, and do a comparision, I have a felling that
optomizations are performed in the clone versions including some
assembly where as yours was full C code or did you complile the clone
one as well ??, I also recon different compilers make a difference,
mind you we have seen that one ourselves

All three of which Linux has in abundant quantities, and MS unfortunately lacks.

Linux is definitely stable. You can leave it on continuously for a year (And actually use it the whole time) and it will not ever crash.

Linux is well documented. Better than any other OS out there. Look around in sites like www.linux.org to get an idea of the kind of documentation that there is.

Linux conforms to standards. It's compatible with all Unix programs, and even supports DOS partitions cleanly, integrating them with it's own. (Unfortunately, MS thinks that it can create it's own "new", "accepted" standards on a whim.)

So, as you see, Linux fits in quite nicely.

I didn't have the correct figures on hand at the time, so I simply scaled the "DX/33" figures up. (Bad practice, I know).

Having just done the calcs again, I see that my "44" was wrong. I simply scaled the 20 MIPS (Intel's claim at the time of the 486 launch was "15 MIPS for them 486/25, 20 MIPS for the 486/33") up by 1.7. But something went wrong somewhere.

The best figure I could get was 34 MIPS. ("Dyslexia of the typing fingers" is what I plead)

Should have gone searhing for the correct figures. Sorry.

> GM> 040/66 ("DX2") is 49 MIPS
> GM>
> GM> Pentium 60 is supposedly 100MIPS

040/25 was IIRC 22MIPS, so linearly scaling it to 33MHz, then scaling it by 1.7 (to "clock double" it) gives (22*(33/25))*1.7=49.3 MIPS. (I am not too happy about the "linear scaling" of the 25Mhz MIPS rate however.

(I have a niggling suspicion that 040/25 was 18 MIPS, 040/33 was 22. In this case the figure would be 22*1.7=37.4. But, I have been wrong in the past with such suspicions)

Re: P5/60 = 100:

That came from a number of PC computer mags [hangs head in shame at reading and then reciting opposition propaganda] at the time of the Pentium release. The 66Mhz was "over 100Mhz", and then Intel would release a 60Mhz "entry level" model, which also met Intel's "100Mhz" target.

P5/60 equalling dx2/80? Crap motherboard/chipset in the P5?

But unfortunately Intel is catching up fast. And Motorola have given up
on enhancing the 68k line in favour of the PPC.

Hi

Hehe I have a PC running Netscape and an ST running STiK / CAB at
home. My PC has got 8 MB of RAM, my ST just 3MB. Weird weird
weird... my ST browser is faster than Netscape...

I'd like to add, that I don't find WinWord, Excel or any other program claimed as "standard" the only solutions either. I think that learning basics with a program that doesn't even properly work with 8MB of RAM and has billions of (useless) functions is not what kids want. Or do you think any kid/teen could buy an expensive Pentium with 16MB of RAM after he/she will have seen it in his/her classroom? I'm namely teenager myself. As teenager - who has used ATARI before - I have specific claims that can not be answered by Microsoft products. Especially at present, now that Microsoft is almost getting the monopoly for Operating Systems, one should teach kids that other Operating Systems work and have great advantages. They should be taught how to use other platforms. Platforms like ATARI and Macintosh! Best you should have all kinds of platforms in a classroom. But if you can only have ATARI, use STiK / CAB to connect to the Internet. It's freeware unlike Netscape.
-Marco A. Kummer, 100341.411@compuserve.com, ATARI / Windows programmer

Does that Atari emulator run? I've got the demo that I've download of the internet, but it doesn't seem to run anything. Though it does mount some diskettes (not any that have been formatted at higher settings) and GEM seems to run quick, but not much else happens.

Any help would be appreciated. By the way I'm running MagiC on a 040 Mac with sys 7.1 with 8megs ram.

Steve

I dunno. I think Apple will pul through. Especially when they stil have PowerMacs on back order (about 100,000) Plus with new technologies that its has developed (QuickTime 3D and new fast image mapping) and the new os that is going to be relased should help them out greatly. Win 95 seem to be the greatest thing yet for DOS machines. But Mircosoft just copied the hoopla Apple made about System 7 when it first came out.

Apple paid for that inventory awhile ago and is much less than write down of the value. Thus no cash is involved. Apple will lose the value of the inventory.

Unless this is a constant situation. I doubt it. From what I have been told,
Apple will be more careful in their product planning by giving what their
customers want not what Apple thinks they should have. I suspect that the 5400
and Instatower line for the home/education with higher 603e clock speeds will
be a success and profitable.

I've had NT up for several months in a row with no problems. Only
took it down when I upgraded to NT 4.0 beta and move from one house to
another.

So... That doesn't mean that it's better than other Unix systems...

>Atari news groups.  Your new fancy puter that boring?

This is exactly the answer I expected.  Sorry, but I didn't dump my Atari
for a PC.  And I occasionally visit this newsgroup to see some Atari
advocacy...but all I see are ruthless attacks on other platforms.  What
about promoting Atari's strengths and marketability?  Almost everyone here
```

seems so bitter and hateful about everything.

>Ya, and the Atari Compendium which contains enough information to write
>a full fledged app is smaller then most of those PC and MAC books which
>you people claim to be tutorials and such. Ha ha ha ha... Heh he...

So? There are so many Mac/Pee Cee books out there on so many different subjects, and not all of them low-level reading. There is a demand for reference and tutorial material, dictated by the size of the user base--and there's nothing wrong with that. If we had STs in place of the PC or Mac, we'd see shelves filled with ST books.

>Now I'm laughing too.

Hello. I was wondering if one of you Atari gurus could help me find the Atari game called Assault for the PC, if there is one. My girlfriend and I used to play it all the time at her university's arcade, but the machine has since been moved and we were both quite bummed about it.

  Any help would be greatly appreciated.
  Thanks in advance,
    -M@

Accurate MIPS figures are hard to come by, but the AMD DX4-100 is around
50 MIPS, maybe more, depending on who you believe.

>I would doubt that as in my experence a Pentium 60 is about the same
>speed as a DX2-80 around 23.3 MIPS (perhaps slower), note this is

>I seem to recollect once hearing (perhaps reading) the 68000 was
>around 8 MIPS

An 8 Mhz 68000 is between 0.8 and 1.2 MIPS. I've used the same CPU benchmarks
on my 8mhz Atari STe, and my AMD DX4-100, and the DX4 consistantly comes
out 40-50 times faster than the STe, so if the 68000 really was 8 MIPS as you
say, than my DX4 would be at least 320 MIPS, and I KNOW that's not the case.
(It'd be nice though :))

: Oh, how I enjoy reading terrible, dismal, future projections of life
: in the IT community 12 to 36 months into the future. It just gives me
: a chuckle while I work deep in the chasms of an IT department of a
: fortune 100 company....

Oh, how I love to read learned responses from people in the chasms
of an IT department in a fortune 100 company, considering I have
spent the last 16 years working at the pointy end of developing
Software and hardware products worldwide, having built the NOS
platforms for Armies, governments and the odd tiny company like
British Steel and Pepsi Co. Want to compare CV's?

: How long is it going to take for you to realize that the world is
: moving toward this concept of "Open Systems"?

This is why NT is going to be POSIX 2. compliant some time 'real
soon' now?

: How long is it going to
: take for all of you to realize that only OS's that are relatively::

:   * Stable
:   * Well Documented
:   * Tight in Conformance with Pre-Existing Industry Standards

Hmmm, sounds like UNIX to me.

: will ever have a chance of survival in the corporate world? Let's
: take a look at these three issues.

: Conformity with Standards
: Being well versed in the technical support arena for networking the
: family of Microsoft products, I can tell you from experience that
: Microsoft did not fully conform with several key concepts in the
: construction of their IP protocol. (See Info World Magazine, Front
: Page, April 1 edition). By "enhancing" their WinSock interface, and
: failing to document their "enhancements", they have created a
: programming problem that is not soon to be unraveled.   This has
: resulted in several applications (10 according to the article)
: released by other software manufacturers that fail in Windows
: networking environments. Also, Microsoft's implementation of the
: Domain Naming Service for Windows (Microsoft named it WINS (Windows
: Internet Naming Service)) is another example of a feature of the
: Microsoft IP protocol that does not conform to existing RFC's in the
: market place - this makes the WINS feature a proprietary standard, and
: hence a danger to use in a true IP based environment.

True.

: About the Unix World: In my opinion, the reason why UNIX will
: continue to falter in terms of market dominance is because there are
: so many different flavors of it in circulation. I believe that UNIX
: will never realize its full potential until someone releases ONE
: variant that will "set in stone" certain core functions and
: capabilities for the OS. As it is today, there's SCO UNIX, HP UNIX,
: IBM's own flavor of the stuff,

All AT&T USL based operating systems (SCO will be building up to V.4 with HP as a partner).

: and then there are the "freebies":
: Linux and the like. Don't take me wrong - I realize that UNIX has
: many strengths, but the ability to modify the core operating system
: itself is not one of them.

Agreed. In the past one would have been loathe to suggest a freebie UNIX into a corporate environment. Linux has the level of stability to do so. No, not all of the corporate world are going to adopt Linux as a baseline NOS, but some will (and are doing). How many small to medium ISV's are running Linux these days? A good percentage I would suggest.

: The point: when spending large amounts of money to build an OS,
: conform to industry standards. This will insure acceptance of the OS
: into existing networking environments. And in this day and age with
: corporate networks only growing in response to this imagined need for
: internet connectivity, conformance with standards, especially
: networking, will become a core requirement.

Whilst not in the bowels of a fortune 100 company (as I run my own business) my current assignment is to build an intra-network between Queensland Rail and BHP (two relatively small companies). The baseline NOS at both ends; UNIX; the reasons; the ones you state.

: Stability
: Any new products released on the market, whether hardware or software,
: in my opinion should undergo a much more rigorous testing program than
: current products undergo today. For example: many of these Computer
: Manufacturers today think that since all their new machines now have
: Flash BIOS support, they don't have to worry so much about allowing
: bugs to creep out in their BIOS releases. This is totally wrong!!
: Any and every bug that creeps out can make the difference of life and
: death for their products - especially since the Corporate entities
: today are starting to test products prior to purchase! You would not
: believe the horror stories I could tell about how some major
: manufacturers' machine, loaded well and priced right, went down in
: flames simply because they had an "acknowledged" bug in their BIOS

: that would be corrected in the next release. Geez - and the reps when
: visiting during the tests couldn't understand why was a concern to the
: corporate entity when the problem would be resolved in a "couple of
: weeks". To the corporate entity, Time is Money - and those couple of
: weeks would hurt the company's productivity if they purchase that
: "defective" product.

Or even a peice of vapourware.

: The point: before sending a product to market, take the time to test
: it and make sure its bug free. When word gets out that the product is
: reliable, demand for the product will soar. Bottom Line: STABLE
: PRODUCTS ARE GOOD. Oh - by the way - this example doesn't just apply
: to hardware faults - but to software faults as well.

: Documentation
: Finally: documentation. I don't think I have to expound on this since
: if you are reading this note, you are fully aware that an OS, and
: building Apps for it are worthless unless properly documented.

: Beating up on Microsoft is silly, and futile. The industry has long
: cried out for a single OS standard - I can remember people crying for
: a single OS as early as '83. It might have taken Microsoft 9 years to
: get there, but NT (NOT 95) is Bill's answer to the call.

Funny, In 1998 whilst doing work for DuPont, British Steel, Ford et al
Bill told me that OS/2 was the standard to adopt.

: It's
: smashing the daylights out of OS/2, Novell, and Banyan Systems - and
: now, since the Federal Government has declared it an "Open System",
: and since NT meets C2 level security requirements,

Until it's put on a network.

: its' proliferation
: in the industry is only going to increase. I personally think that
: people that get started ASAP and learn the environment and how to
: service it will be employable for the next six to ten years. Those
: that continue to throw rocks and geer at it will be the true losers.
: It may not be the best product in the world, but given time to mature,
: NT is going to be the next OS standard - both at the desktop, and at
: the server.

It'll get the desktop (not before time) but the NOS war has just
begun.

I don't need to upgrade my skill set, I'll just wait until
NT turns into a UNIX variant and then use it as normal :)

: Please send your response via EMAIL to: KingRat@OnRamp.Net

:   Regards
:   Dr. Corruption

Mark (written the odd line of code myself) Addinall.

You have the machine for the job, but 8mb is kinda slim. I have not used the demo version, but remember that MagiC Mac does not support ST low or medium. I'm not sure about System 7.1. I <think> I read that at least 7.5 is the best. My manuals are at work. Go to FTP.CNAM.FI (pub/atari) and brouse around for some good files. I know that Klandeski, the Positive Image demo, and many of the other "Newer" softwares run fine on my Quadra.
I'll post a list of what I have working this week if your interested, or e-mail me so I can tag your address at work and mail the list to you.

Mike

Sorry for the crosspost but trying to reach an informed party.

Where can a guy get one of those tiny redesigned 2600s - what were they called after the redesign???? Are there any problems with the redesign??

Will the 7800 really play all the old 2600 games?

Thanks!!

James

Then why not just use Win95?????  You are misundestanding something here....
The whole huge point of NT is to have a  Unix clone for the Windows
market.

BY>figures made up by some manufacturer to claim their processor is
BY>greater that the competitions.

GM>P5/60 equalling dx2/80? Crap motherboard/chipset in the P5?

Hmm possably, wont name the manufactuer (sp?), but it interesting to note that many of us in sales and usage of these beige boxes, we compare a DX4-100 to a Pentium 75, the processor speed is comparable with the Pentium only slightly on top in most in most instances except 1 area (admitidly becoming more important as games players want better more relistic graphics), video.

GM>But unfortunately Intel is catching up fast. And Motorola have
GM>given up on enhancing the 68k line in favour of the PPC.

Interestingly though only catching up on the 68k line, and not willing to drop that older system support (DOS) from processors up until now ie the Pentium pro, interestily enough though no one is willing ot go out on a ledge and use it yet due to so many years of backward compatability

Anyhow I should bug out now as this is being done on one of those horrid biege boxes. Unfortionatly my trusted Atari was kill due to some rain + 1* idiot fellow worker, whilst using for an audio task I would not trust to a clone, long story cut short :-(

Cheers
havoc

Don't you need this NVDI mac thing to make something work.

This may not be the matter cause most of the ataris got only 4 megas
so this let 4megas for the operating system what is quite enough.

I can't understand how IBM and its clones have been able to grow so enormously! Imagine this: You by an IBM, Windows being shipped with it, the seller tells you that you need at least 16M ram and 1G harddisk! What?!?!?!

Why this??? As I have understand it, it's mainly because of Windows. How can people so easily accept this? It's an obvious waste of resources! Some people argue that it's development. I say it's poor programming!

Microsoft obviously don't care about optimization and efficiency! Windows is only a stupid OS! It should not demand so much from the computer! An Atari with MagiC only require 1/2M ram and about 2M of harddisk space to multitask.

I think it's a pity that Atari partly left the arena, because I really do think they could have shown how to use resources much better!

I've also heard in the university world that they think Windows is far too limited to use professionally (really!),
so I find it strange that so many people want to use it!

>> in the form of selling below cost, they lose it in the form of
>> valuing below cost. The financial effect may not be immediate, but it

>> is there, which is why it is reflected on the income statement. If no losses were incurred, no adjustments would be made.

>Apple paid for that inventory awhile ago and is much less than write down of the value. Thus no cash is involved. Apple will lose the value of the inventory.

You still don't get it, don't you? What will that mean for the future sales of those units? These are still LOSSES, Peter, face reality.

When Atari took write-downs for inventory, that translated to bigger losses in later quarters... look at the events. You know this, Peter, and it will be no different for Apple.

>> However, Apple continues making money-losing models. This means that in addition to writedowns, they take a hefty hit on revalued new units sold below cost. Common sense shows that money is lost when revenue is less than expenses.

>Apple maybe making less of the money-losing models now that their Colorado plant has been sold.

More shades of Atari's past, Peter. Atari sold off assets to cover losses and write-downs, if the trend continues for Apple, they will go into the same downward spiral that Atari went into.

>> -
>> In short, the loss doesn't translate into immediate cash drain, but the long-term effects will include repayment of supplier credit above and beyond the valued amount (a cash drain), and, if applicable, any other variable and fixed costs accrued above the reassessed value of the inventory. Not good, not good at all.

>Unless this is a constant situation. I doubt it.

You DOUBT it!? You DOUBT it!? Where have you been, Peter?! Apple's marketshare has been declining for over 2 years now. It is finally catching up with them. If Apple had realized there were severe problems looming on the horizon 2 years ago, they could have avoided this disaster. But their stuck-up attitude blinded them to reality. And now it's time to pay the piper.

> From what I have been told,
>Apple will be more careful in their product planning by giving what their customers want not what Apple thinks they should have.

At least they've recognized one of their problems (finally). But this looks like a FEEBLE attempt by Apple to try to regain consumer trust. Just HOW are they going to do this? I don't see any solutions or answers coming out of Apple right now... they're just desperately trying to cover their asses.

No, Peter, the B.S. they're spouting is just another Apple "money grabbing scheme" (quoted directly from you).

This is fun, Peter. Watch the worm squirm.

/Kevin

If that was the point of windows nt then IMHO it is a colossal failure.

Anyone who comes to windows nt hoping it to be like Unix is in for
some major frustration and disappointment - there will be a steady
supply of rude awakenings and unpleasant surprises.
If you need Unix, you'll need to run Unix.

OTOH If you are satisified with the windows 3 user environment but
want more stability, you'll love windows nt.

Yup

:: will ever have a chance of survival in the corporate world? Let's
:: take a look at these three issues.
:
:: Conformity with Standards
:: Being well versed in the technical support arena for networking the
:: family of Microsoft products, I can tell you from experience that
:: Microsoft did not fully conform with several key concepts in the
:: construction of their IP protocol. (See Info World Magazine, Front
:: Page, April 1 edition). By "enhancing" their WinSock interface, and
:: failing to document their "enhancements", they have created a
:: programming problem that is not soon to be unraveled.   This has
:: resulted in several applications (10 according to the article)
:: released by other software manufacturers that fail in Windows
:: networking environments.

(responding to first poster)

First of all you sound silly here talking about how Microsoft not
conforming to "several key concepts" in their IP stack, and then using
problems with Winsock implementations as an example. Show me an RFC that

defines Winsock! You're quite the comedian.

::Also, Microsoft's implementation of the
:: Domain Naming Service for Windows (Microsoft named it WINS (Windows
:: Internet Naming Service)) is another example of a feature of the
:: Microsoft IP protocol that does not conform to existing RFC's in the
:: market place - this makes the WINS feature a proprietary standard, and
:: hence a danger to use in a true IP based environment.
:
:True.

Which RFC is it that defines a dynamically updatable naming service?
Dynamic DNS is nowhere near ready for prime-time.

[really big snip]

:: It may not be the best product in the world, but given time to mature,
:: NT is going to be the next OS standard - both at the desktop, and at
:: the server.
:
:It'll get the desktop (not before time) but the NOS war has just
:begun.

I think it has the best chance on the desktop too, in the long run.   The
server is as you say a lot more up in the air.

:I don't need to upgrade my skill set, I'll just wait until
:NT turns into a UNIX variant and then use it as normal :)

This has the ring of truth to it.

With Escom's statement that the next generation
of Atari system will be based on the Power PC
that means that Atari users will have access to
the Common Hardware Reference Platform or CHRP
to use the buzz word.

This opens up the possiblity of multiple CPU's
and operating systems in the one computer!

More details are at the site listed below.

Keep the faith - down with Gates and MS

Yours Sincerely,

Tom Waller Managing Director

I have for sale a ATARI 520ST+ computer
(HOLLAND)

With:
- 2.5Mb of memory
- 28Mhz speedup card built in
- hardware 386-DOS card
- 3.5" en 5.25" diskdrives
- harddisk 105MB
- HD and powersupply built in transparent case
- clock built in
- B/W and color monitors
- printer
- mous & joysticks

- books (Dutch)
- lots and lots of software (Prof. and games, more than you can imagine!!!)

everything in good shape, and working properly.

The computer will be sold for any reasonable offer..

If you are interested mail me!!!

>I can't understand how IBM and its clones have been able to grow so enormously! Imagine this: You by an IBM, Windows being shipped with it, the seller tells you that you need at least 16M ram and 1G harddisk! What?!?!?!
>
>Why this??? As I have understand it, it's mainly because of Windows. How can people so easily accept this? It's an obvious waste of resources! Some people argue that it's development. I say it's poor programming!

Or damn good strategy. Launch a GUI that is so complex you are guaranteed to keep control over it.

>Microsoft obviously don't care about optimization and efficiency! Windows is only a stupid OS! It should not demand so much from the computer! An Atari with MagiC only require 1/2M ram and about 2M of harddisk space to multitask.

Right from way back, PC software has always required leading edge technology. If you ensure today's machines won't run tomorrow's software then you ensure people upgrade which means they also get to pay for the new OS again.

>I think it's a pity that Atari partly left the arena, because I
>really do think they could have shown how to use resources much
>better!

I'm not sure about that. Look at MultiTOS. And why develop the Falcon instead of adapting the faster TT?

MagiC is a fine example of what can be achieved with a small dedicated team. It seems the bigger the company, the bigger the mess. I wonder if there is a formula for this? :-)

>I've also heard in the university world that they think Windows is
>far too limited to use professionally (really!),
>so I find it strange that so many people want to use it!

I think the original Windows was equivilent to TOS 1.0, a bit naff but it looked pretty and was a revelation in the PC world, as was TOS 1.0 in it's day. I suppose 3.1 was akin to TOS 1.4 in that you could say it was usable.

If Bill Gates decided to do a mass experiment, I'm sure he could licence a unix, make the GUI look like windows, port the major Microsoft software to it, get a few groovy games and ship it in all the new machines as Windows PT (piss take). People would buy it and love it. It would even work well. He would also put himself out of business in the process! [hoorah] :-)

As much as I would like for this to happen, you're probably confusing Atari and Amiga here. Amiga was bought by Escom, not Atari. Atari recently merged with JTS, a harddisk manufacturer.

I would agree with that and the Power Pc or CHRP is a safe bet to take over from Micro$oft or MiccySoft as us Acorn users call it check out my commercial web site at the url below for the latest poop.....

I like your style Mike - and I agree with you Atari were good and
like Acorn 32 bit from the late 70's.   Keep up the good work -
see my Web Site for details on the common hardware platform that
may in the not to distant future allow me to run Atari software on
a co processor along with Mac and WinTel stuff...

I think that this is the biggest reason that so many people are turned off by Apple computer. You hit the nail on the head big time! Apple has a tendancy to ignore what the market really wants and produce other things. My loathing for System x.x (you name the rev) stems from the almost secret manner that they deal with everything. Hide those system files...we don't want our moronic customers messing up their computers...Use the same menu bar for every application ever written, our moronic customers can't figure out anything that varies in any way from our template. UGH!

Sorry, I'm rambling...thank god I no longer create Mac related hardware, and thank god I don't have a Mac on my desk at work anymore....I'm saved!

Jim

If you're talking about Windows, you're right...unnecessary complexity (compared to everything else). But software that's more complex USUALLY can do more sophisticated things. A skimpy little 35-page manual won't do for QuarkXPress, for example...

>>from novice to intermediate to advanced, plus specific subject matter like
>   Most are your Macs for Dummy's kind of books.

There's a lot of those, but everybody thinks they can put out a better book. And if there's a market for it, why not?

>>want to expand their knowledge in certain areas. I recall seeing books
>>like this for the ST back in the '80s.
>>   Most were programming manuals. Not gutenberg sized tomes on how to
>   use the filemanager...

A lot of gaming books, too. But Filemanager could take up entire shelves...

>>You're stirred up, all right. And I'm not hurting...just smiling to
>>myself. I used to post messages just like yours waayyy back in my BBS

>   for less... would make me cranky too...

By "waayyy back" I mean several years, not decades, of course. It's still nostalgic. :) But the only bitterness I see here are from those who refuse to advocate their own platform and choose instead to bash others.
Sigh...

GM> Likewise 040/486 is a more valid comparison.

Hmm....figures I have rate a 486DX/50 at 22 Mips

486DX2/66 is 26 Mips

030/20 is 8 Mips so a 030/32 would be around 10 Mips
040/33 is 26 Mips

A 040 is nearly twice a 486DX @ the same clock rate
A PPC (not sure which model, but a 32bit job) is more then 90% faster
than a Pentium @ the same clock rate.

You and I both know that Motorola have always been ahead of intel :-)

GM>
GM> Was that a _GENUINE_ DX50, or a clock-doubled DX2 25/50.

I ported the Unix version of POV to my TT, and it was very close to the
DX2 50 (Sorry Chris) at rendering the same image at the same size
When I got TT RAM it was matching it. I was also "embarressing" my
40Mhz 040 Quadra owning friend, it was too much slower (can't remember
how much slower) but it had him "worried".

Cheers
Marcus

Other than the original press release of the Hades , I haven't heard anything.

So if you know more, then could you share it with us.

Only ever read one/two articles of the Eagle / Medussa but never seen any adverts of then for sale. Atari World recently did an feature on the OS's available for the atari platforms (?) but could not do a hardware comparision due to limited availability. Anyone got any specs price/performance comparisions on Fast atari TT/Falcon clones.

Andy.

AHAHAHA! I wouldn't normally laugh at this kind of thing, but because it has to do with something so near and dear to you, I just can't resist.

Why don't you tell us about Apple, Peter? Where should I start? Perhaps with the fact that Apple is going to take over $700 MILLION in losses? Seems that Amelio is going to attempt some huge one-time write-offs and losses to get the company back in the black again.

But this is gonna hurt. Really bad.

Kinda reminds me of the Atari of the mid-80's.

Also, Moody's downgraded Apple to JUNK bond. And industry analysts don't expect Apple to see a single profitable quarter this year?

And what's this I hear about a significant portion of the losses to be taken are from back stock and inventory? I thought Apple's computers were selling like hotcakes? I think this mess is more from mismanaged inventories than back-orders. Apple was just trying to sugar-coat the situation, now the truth becomes known.

I was at CompUSA Saturday, and I watched the PC and Mac displays for a while. What a contrast. The PC section was filled with consumers (I counted 19), while the Apple section was neglected, only 3 customers were there (and 2 were kids!). Nice stacks of Macs here, too, you can't blame sales shortfalls on lack of stock.

Apple has a long and rocky road ahead of it. No doubt Peter will respond to this, and tell me about how things are turning around and that he has info that he can't disclose and how I'm in denial. Yeah, sure, whatever you say, Peter. Should I compose your response? I'd probably spell it better than you.

This is just so ironic. Peter flames us Atarians for being on a sinking ship while the moron can't see that his own ship is sinking! AHAHA! What a fool.

See you on the bottom, Peter.

/Kevin

There is no "Good Times" virus! The whole thing is a hoax. In fact, shortly after ST Format reported the virus someone wrote in saying that the whole thing was a fluke. Even the college lab I used had these warnings, but it's all false. File this under chain letters and modem taxes(veterns know what I mean). If even the FCC believes this crock, then imagine if they actually try to "regulate" something they know little about :)

No.

You've got the right idea, but I think you have made a little mistake.

The Good Times virus only attacks hoaxes.

The IBM and Mac are the hoaxes.

Unfortunately noone has caught on yet to the joke...

>system is replaced by current technology.

Some of us live in the real world where money is a limited thing. Everyone
doesn't have the liberty or ability to grab the latest and greatest as
soon as it hits the shelf. Some of us have to make due with that which
we already have. The market doesn't want to acknowledge this for the
most part. That is why Netscape will barf on a slow 486, nevermind what
an underfunded or poorly managed school system may have lying around.

Furthermore, the ST (& the other 86Ks) were ahead of their time wrt to
kludge-klones. Despite their age, they are not as obsolete as you would

have everyone believe.

>
>There are PTA (or PTO) groups which will hold bake sales to buy modern

>use platform for this particular application.

Unless you can provide specific details (as specific as mine), you really
shouldn't comment on that which you know nothing of.

Well, that's the whole problem now isn't it. People aren't willing
to find solutions. They won't actually use their machines unless they
are led by the nose into it.

>
>Thanks for making my point again.

NO, you have made mine. YOu have shown time and time again that it is not
the superior standardized interface, superior search engines or the
information itself that you are interested. You don't want our kids to

```
    have the 'meat and potatoes' of the net; you just want them to eat the
    'candy'. There's more to the net than just eye-candy. What is more relevant
    to learning is more than adequately accessed by lynx.

>
>Using STs on the Internet is for computer geeks and rocket scientists.

    STOP spreading LIES!

    ST's are for anyone not afraid of a command line (how ironic).
    Incidentally, this includes anyone willing to use a clone, especially
    an old 386.

    Also, ironically such a 386 as you provided as an early example would
    also be forced to be used in the same way as the ST as it would cost
    the price of the new system to upgrade it to the point of being usable
    as a win/netscape browser.

While it is true that MagiC Mac may not run software utilizing a DSP such
as the one in the Falcon, printing is pretty much stright foward. A cable
called Power Print is installed on the Mac and this allows MagiC to print
through the serial port to a parallel printer. Calamus SL has the option
to print through the serial port and does not require the cable. As a matter
of fact I can print through the ethernet at work to a remote printer with it.
Geneva, like MagiC in some ways, is a replacement O/S for TOS based systems.
MagiC Mac is a system extension for the Mac that allows TOS software written
under the same guidelines as MagiC to execute on the Mac. MagiC Mac does not
emulate TOS, it is a Mac application that runs software wrote for the TOS
machines.
I think the only emulation that really goes on is the FPU emulator for the 040.
It is the same one that is used on the Medusa and Hades.

Does that make sence? :)

It would have been nice for the MagiC Mac authors to have considered the
840AV model as it does have a DSP. With the new Apex 3.0 due that is suppose
to operate in any resolution, Apex on the Mac might have been possible.

I would like to know where he can find a "$100.00" 040 Mac. I would especially
like a 840AV or a Quadra 900 for $100.00.
Best price I have seen on either is around $1500.00 with only 8mb, 500mb, 1mb
video.
Put up of shut up. If you can find them, i'll take a half dozen.

The DSP on the Mac is an AT&T, while the one in the Falcon is a Motorola
56001. They are highly incompatible, and cross-compilation, or writing
an emulator for the Motorola chip for the AT&T chip isn't cost-effective.
Not to mention that the Falcon system bus handles the DSP differently than
does the Mac, as an integrated system component rather than a sound engine.

Obviously, you don't have much experience with installing Netscape in non-home situations, or puuting TOS boxes on the Internet. I do. It's really not all that tough to do either. Different methods are required for each, but neither is impossible, and both produce satisfactory results (which is all one can ask for without buying a whole new bank of machines).

>I just watched a girl in an office near mine install Trumpet
>WinSock and Netscape, type in her DNS and email addresses, and
>she was up on the WWW in 15 minutes without ever breaking a
>sweat. She didn't have to learn anything about the computer or
>OS or compilers.

Yep. She'll do fine until she makes a change in installation for her OS (like installing a new graphics driver, a sound card driver, or Windows 95). Then, she'll not only need to reinstall Trumpet, but she'll need to set up different booting options to disable her CD-ROM drive if its soundblaster-driven rather than SCSI. She may need to reinput her IP address, among other things. It gets complicated very quickly. With STiK, you install it and forget it.

>True enough, but why handicap them with an obsolete platform to
>begin with? The girl in my office has dozens of people to turn to

I still am confused by this "obsolete platform" talk. What is obsolete? Is my Plymouth Valiant coupe obsolete? How about my good old Reliant K car? (I like Chryslers <grin>). They cruise well, they're tough as nails, and get great fuel mileage. Of course, their styling isn't "modern." Most of the "obsolete computer" threads stem out of the mine is bigger than yours paradigm, in which, styling and glamour overtake reality. Detroit and Japan

have convinced consumers that purchasing a new car every four years is necessary. Silicon Valley has convinced America that purchasing a new computer every two years is necessary. This is complete garbage. As someone who helps businesses set up computers, I can attest to the fact that Amigas, STs, and other machines do a fine job - just as good as "modern" Intel boxes. The software, which has been developed and refined longer, is more stable, more functional, easier to use, and frequently cheaper.
-
I define obsolecence as the state of when something loses all utility. In this case, a Ford Model T is obsolete, it can only go 30 MPH tops. In the case of the TOS platform, it is far from obsolete. Evidence of this is easy to find. When neighbors of mine lose the great feeling from playing CD-ROM games on their new Pentiums, they knock on my door and ask to type up term papers under Papyrus on my Falcon. Why? "It's so much faster and easier than my computer." That's a direct quote.

>for help. I'm the only one who knows anything about STs, and she
>wouldn't know that.. she'd be lost with an Atari.

Had to chortle at this one. "Hi, can anyone help me? My WIN.INI file has been corrupted. I keep getting a general protection fault error when loading Netscape." Solution? Call the 900-number tech support hotline.
This argument that PC support is cheap and plentiful is BS. My experience finds that TOS users tend to be far more helpful, knowledgable, and friendly.
Next thing you know, you'll be extolling the ability of the PC user to go to Computer City and get tech support and advice from the salesmen there.
:'D

An Atari 800 isn't a TOS machine.

Can you say "RED HERRING"? Good, I knew you could.

>to demonstrate the kinds of things which are CURRENTLY in the mainstream of
>computer applications.

Which are? Spreadsheets, databases, dekstop publishing, word processing, drafting, drawing/art, photo retouching, terminal software, what else? All of the above are available for TOS, and are actively published, supported, and updated. Clutching at straws, aren't we?

I was reading an education journal today in the "teacher's lounge"
(*gasp* that place where mere students would dare not intrude)
and it had some interesting facts. First of all, it said that
97% of schools with Internet access hooked up via modems. It
also stated that a majority of these schools did not have graphical
browsers but, instead, used VT100 terminal programs to access Lynx.
BTW, 49% of schools have Internet access. Makes one feel sorry
for that teacher in California, huh?

Ah, so chips = computers?!?!?!?!?!

Of course, if owns a TOS box, he gets a lot more functionality out of it,
without the inane processor forced upgrades. This is a major asset to
some of my clients. They appreciate that the Mega4 with Calamus that
they're running now, purchased in 1987, had a far more powerful interface,
and a far longer lifespan than the 286 purchased at the same time.
Same for Falcons. Any application similar to APEX Media or DAS Layout on

the PC is going to require far more horsepower than a Falcon, and will have a shorter lifespan because of the phoney forced upgrades. A multitasking OS requiring 8 megs to function properly is ridiculous! The Amiga was doing that on 512K in 1986, and was/is more stable and easier to use! Of course, the PC makers won't realize why small business users aren't buying their systems. Most small businesses I know use non-Mac/non-PC (by "know," I mean "consult for"). For one thing, they keep their competitors guessing. If a competitor has seen one brochure made in Microsoft Publisher, he's seen them all. Brochures in Calamus, however, have a "bad habit" of standing out (and getting noticed)! :')

Apple's definitely in a mess.
-
Amelio is taking a gamble that writing off all of Apple's problems in one fell swoop is the answer. However, it effects Apple's credit rating and ability to attract and maintain working capital. It also badly hurts Apple's ability to borrow, and makes it very expensive. _If_ Amelio's plan works, and Apple returns to the black with five quarters, he did the right thing. If Apple is still losing money in five quarters, the firm will have lost its preeminence in the computer industry forever. It will simply be another shrinking computer maker in a market filled with them.

For your edification, here are the contents of the FREEWARE, free
to use STiK WWW 1.30 package:
-
* STiK, originally by Steve Adam (Australia) and now by Dan Ackerman (USA). This does the low-level networking stuff to the Internet.
* CAB, by Alexander Clauss (Germany). The HTML/WWW browser.
* CAB.OVL, originally by Tim Newsome (USA) and now by Dan Ackerman (USA). This is the missing link between STiK and CAB.
* Antmail, by Dan Ackerman (USA). A POP3 based E-mail program.
* Telnet, by Jim Baumgardner and Dan Ackerman (both USA). This is a remote login terminal program.
* Setup, by Guy Harrison (UK). Sets up STiK for you with no hassles guaranteed.

Hmm. . a tad corrupted, here's a rundown:
1) STiK, the TCP/IP stack
2) CAB, a Netscape-compatible (somewhat) HTML-2 compatible graphical browser
3) CAB.OVL, the file that makes CAB and STiK "talk to each other"
4) Antmail, a full e-mail program, allows you to send and receive mail
5) Setup, the oh-so-important single-click installation program
-
FTP is also available seperately, and is easy to add. And use of this
software is free, no fees need to be paid, unlike Netscape. So, Bob
Retelle, what was it you were saying again?

BR Miller<<

Those are your words quoted above, not mine.

My point is that the Internet software solutions available for the ST are both below standard and difficult to install, not that they are completely unusable.

Also, we're not talking exclusively about "computer teachers", as I don't recall the original article mentioning the teacher's specialty. A "computer teacher" would probably have the time and knowledge necessary to set up an ST.

The Mac DSP is not only used for sound. It can be used by any program that
wants to bother. Photoshop uses it to accelerate filters, VideoFusion
uses it to capture video, etc.

Actually, I was refering to hard crashes. Core dumps tho not nice are relatively mundane and rather harmless when compared to just about any Windoze GPF. 'Scape will do more than just core dump some UNIX systems.

UNIX/NT/VMS -- building better OS's to accomodate worse software.

Does anyone know what part's of HTML 2 & 3 CAB does and doesnt do (or does poorly). The size of CAB makes it look like a promising prospect.

Argh! lynx does not support all those Netscape features. And if lynx
doesn't, they are faulty.

>Netscape is pushing the envelope... and suddenly that's a "bad thing"..?

Of course it is. Some people complain about RFC-1521, and that is a more or less democratically developed standard. Netscape is building a monopoly, pushing all other browsers out.

TO: You non-Atari lusers...

Gee, I got STiK/CAB and Oasis/NOS working on my Atari so I guess that makes me a 'rocket scientist' then. Ah, then I must surely be smarter than you lamers who think an Atari can't be used on the net. What a load of crap!

This message was delivered to the news groups via a PPP connection directly to my internet account from my Atari. Read it an weep you weenies!!
You know who you are.

Atari's these days have 16-bit displays people. Get off your duffs and go look at one for crying out load. Stop complaining about 320x200 in 16 shades of gray. Are you deaf? If you don't understand what a 16-bit display is you better buy a book on it. BTW, I have a 24-bit display.

Speaking of books, if the PC's and MAC's are so easy to use, then why is Walden's Books filled with tutorials that are as thick as the New York phone directory!! You don't fool us for a minute.

You only spend your time trying to stir us up cause you know we Atari users see through the BS!!!!!!!!!!!!!!! Always have and always will.
We are right, and you know, we know, you are wrong and it hurts.

Why not take this stupid 'teacher' thread or whatever the hell it started out as to a news.group full of darn teachers. It's getting old and

boooooring...

As I understand, that the restructuring cost is 200 million and the rest is in inventory write downs of Performas that know one wanted. I didn't..

And what about the Atari of the 90's? 1995 Atari sales declined to $14 million.

>
> Also, Moody's downgraded Apple to JUNK bond. And industry analysts

> to sugar-coat the situation, now the truth becomes known.

Apple screwed up royally by producing to many Performas that the market could not bare. The demand for the business PowerMacs are strong with the exception of the 7200/75.

>

Sinking ship? Not a chance.. The difference is Apple can change management were as Atari is stuck with the Tramiels..

Business as usual...The second generation of PCI Macs are set for a April 22 release and with continous product introductions through the summer and fall.

You don't pay attention very well, Thorsten...

Nobody I can recall ever said a PC running Linux is an obsolete platform.

But an Atari ST running *anything* is an obsolete platform.

And my point is that forcing teachers to "make do" with obsolete equipment
of any kind is counter-productive in a classroom.

PETER SINCLAIR-DAY <sinclap2954@cobra.uni.edu> writes:

>And what about the Atari of the 90's? 1995 Atari sales declined to $14
>million.

The Atari of the 90s is irrelevant to most TOS users, Peter. The Apple of the 90s IS the Mac producer. Pretty pathetic trying to point to Tramiel incompetence as a comparative measure for Apple's piss-poor financial performance. Probably even worsde - Apple downplayed the loss to the press and investors, telling them it was only going to be $150 million, only releasing this shocker at the last minute.

>> Also, Moody's downgraded Apple to JUNK bond. And industry analysts
>> don't expect Apple to see a single profitable quarter this year?
>
>Other analysts would disagree as well as Amelio..

Then again, Amelio promised only $150 million in losses this quarter, and now look what we get.

>Apple screwed up royally by producing to many Performas that the market could
>not bare. The demand for the business PowerMacs are strong with the exception of
>the 7200/75.

And they continue to produce models not demanded by the consumer. They are saddled with over a billion dollars woth of this product - and are GROWING the inventory. That suggests additional writeoffs of over $1 billion. Of course, Apple isn't telling any investors the truth about the matter, which is
why doom and gloom rule the day. As a former shareholder (until yesterday), I am rather annoyed by the constant FUD and hype being spouted by Apple - together with results far worse than they promised. Apple is not a holy company - it is a money-loser. As soon as it gets off its high horse and realizes its position in the marketplace is eroding, and confidence in it has plummetted,

it will continue to lose money. It relly is that simple.

Wow, such advice!

>By the way... how much did you pay for your 24bit video card..?

Probably considerably less than it would take to purchase the brand new Pentiums you advocated to replace the STs in the lab. Of course, maximization of current resources is one of those lousy business practices. We don't need it in our school system, what could it do, bring the cost of education into line? Nah, forget it.

That's the cash loss... over $200 million. But combined cash losses, inventory write-offs, and one-time charges are going to exceed $700 MILLION.

>And what about the Atari of the 90's? 1995 Atari sales declined to $14
>million.

Pathetic, Peter. You are trying to compare Apple to a broken company in the video game business? Is that how desperate you've become?

>> Also, Moody's downgraded Apple to JUNK bond. And industry analysts
>> don't expect Apple to see a single profitable quarter this year?

>Other analysts would disagree as well as Amelio..

Amelio is already making mistakes. He is misleading the public and the shareholders with sugar-coated loss expectations and then he shocks everyone with much bigger loss reports. It's a classic state of denial.

This $700 million in losses is just the tip of the iceberg, Peter. The rocky road is just beginning.

>Apple screwed up royally by producing to many Performas that the market could
>not bare. demand for the business PowerMacs are strong with the exception of
>the 7200/75.

Wow, he admits that Apple is screwing up! This must be really serious.

Face it, Peter. Apple is building up huge inventories and they are not moving the product. A few model lines are selling well but that is being negated by the buildup in other inventories. It is expected that Apple will continue to suffer with inventory problems.

Just like my example, Peter, in CompUSA... a whole pallet of Macs sits in the Apple display area, and they're NOT moving.

>> Apple has a long and rocky road ahead of it. No doubt Peter will
>> respond to this, and tell me about how things are turning

>Yawn.. You should worry about the Jag.. No Jag II!

Heh heh, is that all you can say?! You're in pretty piss-poor shape now, Peter.

>Sinking ship? Not a chance.. The difference is Apple can change management
>were as Atari is stuck with the Tramiels..

>Business as usual...The second generation of PCI Macs are set for a April 22
>release and with continous product introductions through the summer and fall.

Denial, denial... you depict the current state of Apple brilliantly. Apple has barely assessed their mounting problems. Losses WILL continue to plague the company, probably into next year. And if they still spout their sugar-coated reality and deny that fact that the company is teetering on the brink of disaster, then they're screwed... BIG TIME.

Unless Amelio (or someone else) can accomplish an amazing turnaround after this year, I give Apple 5 years... and then they're DEAD. Their marketshare will shrink to probably <5% over the next 2 years... and at some point, this marketshare will reach the threshold where developers will not see it as a viable platform anymore... then guess what happens? The same thing that happened to the Atari, Commodore, and countless other computer lines that fell by the wayside.

>> See you on the bottom, Peter.

>In your wet dream..

I thought even you would be able to come up with a better response than this follow-up, Peter. It really goes to show us that you really have no defense in this new round of bad news for Apple.

Welcome to Reality, Peter.

/Kevin

Well, considering that Apples have been around for quite some time in the schools it's not too unlikely that the teachers involved know how to use them effectively. Furthermore, probably aren't so easily encouraged to use them to less than their full potentials.

How does CAB and Lynx fail to live up to HTML 2.0 and HTML 3.0?
Details please.

How is it harder to install?
Details please.

Also, give us time figures.
Details please.

School years almost over. Would a poor undertrained teacher manage to have it running by September.
Details please.

Considering that most ST software (and all that I've seen and I've seen a lot... DBMan, Opus, Calamus, DynaCADD) only requires the loading of a disk or the unarcing of a file to be installed, your statements are very dubious (to put it mildly).

>The rocky road is just beginning.

For clarification and perspective: This $700 million loss represents
a whopping 1/3 of Apple's net worth. What is net worth? Simply stated,
it's assets (like buildings and cash) less liabilities (like accounts
payable). A company with a net worth of zero has assets equal to its
liabilities. A company with negative net worth has greater debts than
assets, and is insolvent. Apple has wiped out 1/3 of its real value,

the amount of assets above and beyond its liabilities. That's one hell of a gamble. If it pays off, Amelio's a genius. If it doesn't, well, Apple's going to have one heck of a time getting credit in the money market.

God, I sure hope so :). I'm not quite sure he understands the meaning of his statement, however. He is stating that the PPC is far superior than the 040 on the Mac. This is true for applications that are wrote in native code, but if you happen to like the software you have, and are interested in MagiC Mac, then the 040 Macs still have a spot. My Quadra 900 has a 50mhz DiiMo 040 card with 128k CPU cache. It runs 0x0 code faster than a PPC, even with a speed doubler. If you upgrade all of your Mac Software for PPC compatibility and purchase a new PPC, well, I think you can see that it is not going to be as inexpensive as stated. But lets look at the 040 Quadra 900. I can buy one for $100.00 (so he says) then purchase MagiC Mac for $200.00. Add $75.00 worth of V-Ram and be able to put 800*600 24bit graphics on the screen. Pick up 24 1-meg simms (cheap, about $200.00). Let see add the 1 carry the 2, that comes out to $575.00. Heck, lets throw in a 1GB drive for $200.00 and a CD ROM for another $200.00. Were up to 975.00, and I have compatibility with most of the major software I use on the Atari, not to mention plug and play AHDI formatted SCSI devices. I think that is pretty cool.

I will however be keeping my MegaST 36mhz 68000/TOS 1.06 to run older Atari applications on. I just love GFA Raytrace. Gun Ship is cool too.

My Falcon with the MightySonic and 32MB of fast ram works nice with Apex Media RainBow II, Expose and Genlock, so I will keep that as well.

If I got in on the Atari Warehouse sale, I will have to find room for another Falcon and a TT. The TT is gonna be bitchen. I have wanted one of those for a long, long time. It will be the DTP machine. The other Falcon will be kept stock for portability, as my other one is in a desktop case with a couple of hard disk, a CD Rom and an EZ-135 installed inside.

Oh man! I forgot about the C-Lab MarkX that I have cash on with TOAD.
Where the hell am I going to put it?

You know what is reallly funny? They all run the best software and
best OS's available, IMHO.

No, I don't really think I need a PPC.

Mike

>is Walden's Books filled with tutorials that are as thick as the New York
>phone directory!! You don't fool us for a minute.

Because there's a market for it. There are varying degrees of help books, from novice to intermediate to advanced, plus specific subject matter like DTP, networking, internet/telecom, games, programming, fine art, etc. A small amount of books are devoted to HOW to use the machines on a basic level, but more appear to be for users who already know the basics and want to expand their knowledge in certain areas. I recall seeing books like this for the ST back in the '80s.

>You only spend your time trying to stir us up cause you know we Atari
>users see through the BS!!!!!!!!!!!!!!! Always have and always will.
>We are right, and you know, we know, you are wrong and it hurts.

You're stirred up, all right. And I'm not hurting...just smiling to myself. I used to post messages just like yours waayyy back in my BBS days, when my friends were slowly turning to Macs and PCs. Ah, nostalgia...

Why are Netscape's features not supported additionally while compatibility
with other browsers is kept up? Just coincidence?

>>nothing irrational about fighting monopolies.
>
>Why?! Just go and buy different software, if you don't like Netscape's, or
>Microsoft's...

Arghl, Netscape is building a monopoly by producing/supporting html design
software that will create Netscape-only pages. If I use Mosaic, these pages
will claim incompatibility (even if they only use html 2), and
Netscape-only functions will not be displayed correctly.

And I hope you don't want to know why monopolies must be fought. In that
case, I'd advise you to get soem basic knowledge on economics.

Welcome to reality.

"Even the weakest TOS machine" is completely useless without software.

The only solutions people have provided here have required programming skills far above the ability and/or interest level of the average classroom teacher, or making do with far lower than today's expected level of performance.

There are no easily installed or used software solutions for the teacher who wanted to use Atari computers on the Internet.

There ARE on other platforms, including "an Intel box".

Atari computers may still be useful in musical applications, and they make marvelous dumb terminals, but trying to use them for Internet connectivity is an inappropriate application.

Sorry I don't have the inclination to do a line by line on your "corrections" (BS though they are)...

Just one question...

Do you have a teacher sitting in the next room who can tell you just how much time she has available to learn how to program an obsolete computer just so she can "make" a sub-standard text browser for her Science class..?

No..?   Then piss off.

Are you an idiot, or do you just pretend to be one so well?
Yes, stock ST can kind of display 512 colors. But ut can't do so in any web
browser available for it.

>>>To install lynx, just type "make".
>>
>>That's an order of magnitude more difficult than installing a PC

>   Quit spreading lies.
>   That is all there is to it.

Yeah, sure. Installing Linux is not quite rocket science, but it IS much more
difficult than installing Netscrape.

That's besides the point, really. ST's in the classroom (you don't really think
they had Falcons or TT's there, do you?) can't run Linux in the first place.

>   Quit spreading lies.
>   The network has to be set up first. This is a lot more difficult than
>   configuring any terminal.

Depends on the OS, but installing Linux, and then configuring it for networking
is more difficult than filling a few fields in any Winsock dialer.

The above does not necessarily represent views of my employer,
my educational institution, or of myself.

> that are not implemented (and have to be emulated).

ObJargonDefinition: "Order Of Magnitude" generally means 10x

Actually, it's not quite that fast. But it can seem it, at times.

882@33 is, I believe, about 350 KFLOPS.
040@33 is, I believe, about 1.4 MFLOPS (1400 KFLOPS)
So the ratio is 1400/350 = 4.

387@33 was reputedly about 150 KFLOPS.
486@33 was reputedly about 1.1 MFLOPS (1100 KFLOPS)
So it's ratio was 1200/150 = 8.

882@33 vs 387@33 is 350/150 = 2.333
040@33 vs 486@33 is 1400/1200 = 1.273

But having the FPU on the same die as the CPU allows the whole thing to speed up some more - no more "Hello. Are you there? Are you ready to receive?" preambles to every floating point op, and no "Hello! Are you there? Have you finished?" ("postamble"?) when separate chips must communcate.

All of it runs at native 040 (or 486 [boo! hiss!]) die speed, instead of the (traditionally slower) board speed.

(I don't have any specs for Functional-Unit Communication Time, but this is generally about ((chip speed / board speed) x about 1.75) if I can remember a [very old] doco I saw absolute aeons ago)

(ObDisclaimer: I am not a chip/board designer, so don't go using that info on any mission critical stuff.)

newsgroups: comp.sys.atari.advocacy,

Wow, I had no idea that there was so much hostility in this group, I asked in my message for information on any new Falcons coming out, there were severall real replies and the rest were flames.

Let's get something straight, the Falcon (and other Atari's) do things that other computers can't and won't do............ever! Wether you are a Mac fan (like myself) or a Windows (person???) or UNIX fan, or what ever, you have to admit that each platform is better and worse in some areas. I have a big intrest in 3D graphics, a 030 based computer does not have the hourse power, nor does a 040 and even a 060 is slow compared to PPCs and PentiumPros, Alphas, etc, etc which still fall short of real time 3D.

I asked for information about a "powerhouse" machine, it seems that the power with out the price is false, the price of a Falcon is just too high compared to low cost Macs with tons of software running on PPC chips.

Not everyone needs this type of horsepower, but I do. A Mac Plus is good enough for me for day to day use, but 3D needs this type of power not stupid "games". I think what is needed is a new Falcon, a Condour or something which has:
2 or more low cost PPC 603e CPUs
 PCI graphics which run common PC cards
 PowerPC native version of MagiC and Ease
SCSI Disk
and a low cost.

I see people paying thousands of dollars for 030s when I read my Atari magazines, but when I read MacUser or MacWorld one can get a 040 for $100(US). The PPC 603e is low cost and faster then a 040, C-Labs should look at the BeBox (www.be.com) which is a low cost high performance machine which runs its own OS. PCI graphic cards are cheap and plentifull as well as powerfull. Yes it would mean a big change, but Macs have improved from changing to a new platform.

However, if you do not do CPU intensive work who cares? A pentium and a

Alto both have writing applications, your paper will be not be better because you wrote it on a fast pentium. But what about games!!!!! Games are for children........that is why 80% of PC software is games........PCs are $3000 Nintendos (sorry I just had to say it).

However in the area of 3D and Video the power is needed, you can try all different things, you can see what a sceene looks like with this level of RayTracing verses that one with out waiting hours. In this area a powerfull machine is needed.

Got any ideas?
Zan

Technicaly the ST hardware is superior to the Apple II. However, because of
the software base, the Apple II in education is has more utility..

      Considering how overhyped Netscape is and how bloated it is, CAB
      just might be a useful or even superior alternative. It's not so
      far fetched.

That's not the point... He was referring to the fact that
Goldstar dropped out of the 3DO business because they weren't selling...
I think...

STOP Spreading LIES!

In reality, even a DEC VT52 can surf the web. It's called LYNX. Also,
any other Net tool (the ones that Bob likes to ignore) are also trivially
available on anyone who can get a UNIX shell account (that means anyone
period). Any term program on the ST will work as VT52 is built into the ST
and any UNIX system can use it as well (simple request to your sysadmin).

>
>The only solutions people have provided here have required programming
>skills far above the ability and/or interest level of the average classroom

STOP spreading LIES!

What part of type "make" do you not understand?
Also, CAB and LYNX have already been mentioned countless times.

>teacher, or making do with far lower than today's expected level of
>performance.

Well, some schools have less to spend than others. Some don't have the
luxury of throwing away potential resources on the word of clueless nay-sayers.

>
>There are no easily installed or used software solutions for the teacher
>who wanted to use Atari computers on the Internet.

STOP spreading LIES!

Vanterm, Connect, Storm, STalker, CAB.

>
>There ARE on other platforms, including "an Intel box".

Well, if the district is rich enough to buy anything it wants, the kids
will likely have better machines to learn on at home anyways.

Also, older intel boxes suffer the same problems as an ST wrt to
your definition of the Internet.

>
>Atari computers may still be useful in musical applications, and they make

>marvelous dumb terminals, but trying to use them for Internet connectivity
>is an inappropriate application.

STOP spreading LIES!

All one needs to get the net is a dumb terminal. This is not a particularly Atari axe that I am grinding. A DEC terminal could do it, an C64 could do it & even a TI/99 could do it.

A cursor addressable terminal can fully connect you to a UNIX box in shell mode and THAT can connect you to whatever part of the net you want to go to.

The Net is not netscape, or the web.

```
atdt <your isp>
login <your login>
pass <your password>

%ftp where.lynx.is.edu
```

```
cd /pub/where/lynx/is
get lynx.tar
exit
%tar <switches> lynx.tar
%gzip <switches> lynx.gz
%make
```

That is all there is to it. Anyone who can handle the MS-DOS shell
should have no problem 1) running a program
2) changing to a subdirectory
3) downloading the file w/ simple command
(intuitive even)
4) exit a program
5) run an unarchiver
6) run another unarchiver
7) type make

You see you ingoramous, a unix makefile (or batch file) has most of the features of a conventional high level language (like BASIC or C). A makefile is itself a program, especially when compared to a DOS batch file. Just like with a SETUP (and that IS the standard mnemonic for windows btw), all the installation details are handled by the program logic. I have programmed both (unlike certain people around here).

Actually, a makefile would probably be better automated as most UNIX command languages are more powerful than most Windows Setup languages.

>
\>No..?   Then piss off.

I just wrote you a tutorial suitable for just about any computer illiterate person (or even cat) on the planet.

I suspect however that you are selling the average (computer)teacher short. I would imagine that someone with experience with the old apples or just dos machines would have no problem with any of the above computing tasks.

If you were pinoccio(sp), your nose would be a sequoia by now...

>Are you an idiot, or do you just pretend to be one so well?
>Yes, stock ST  can kind of display 512 colors. But ut can't do so in any web
>browser available for it.

   No I am not an idiot. However, you are. 16 levels of grey are quite adequate
   for previewing an 8-bit color image. If you desire to gawk at it some more,
   you can view it later, or even spawn another viewer. I presume that CAB can
   spawn other programs.

   Also, the web is connectionless so: exiting CAB for what ever reason to
   do something else (that CAB can't do) wont effect ANYTHING.

   I'm reminded of Amdahl's law for some reason... ???

True, but one needs to understand those fields. THAT is not trivial.
Also, creating the dialin script can also be a hairy experience under
winsock.

>If you're talking about an ST, the answer is... no.

The answer is...yes.

The "AT BUS TOS Card" by Hard&Soft does exactly that, and gives you TOS
2.06 (necessary for IDE drives). There also is the MultiBoard, coming with
SIMM sockets and an ISA slot for e.g. a Mach64 or ET4000 card. (drivers:
NovaVDI and NVDI ET 400� respectively).

>(For the purists, there IS supposed to be an IDE interface for the ST... it's
>from Germany and is about as easy to obtain as the Holy Grail and the Golden
>Fleece.)

You have to do such weird things as writing a letter to e.g. Software
Service Seidel, Heikendorfer Weg 43, D-24149 Kiel-Dietrichsdorf or other
competent Atari dealers in Europe, and you'll then have to write a second
one with an enclosed eurocheque, to pay the goods you order.

Oh, but I forgot: the Holy Grail is also available by mail-order here in
Germany, as well as used Cray XMPs.

Thorsten

Nope, MagiCMac will not run software requiring the Falcon DSP or other
proprietary Falcon hardware. CAB, Oasis and Geneva are likely to run, the
others are not. And even the "clean" software may have problems using the
Mac ports as e.g. serial ST ports.

BobR <76702.1466@CompuServe.COM> writes:

>Welcome to reality.
>
>"Even the weakest TOS machine" is completely useless without software.

Agreed. The strongest Mac, Amiga, Intel PC, Sun, BeBox, and every other make of computer out there is completely useless without software.

>The only solutions people have provided here have required programming skills far above the ability and/or interest level of the average classroom teacher, or making do with far lower than today's expected level of performance.

I don't understand where you are coming from here. Firstly, use of Netscape is a little bit more complicated than just clicking on "Install." My company publishes electronic media and paper media on both a job batch basis and a commercial basis, and I've installed many pieces of software for Internet use on PCs. Installation of WinSOCK or Lizard is hellish. If you're using Windows 95, installation of the Ventana Web Access pack (one of the most popular web software packages on the Win platform) is damn near impossible. Eventually, any user of any computer is going to have problems. Any user of any current internet connection package is going to need to know TCP/IP, IP addresses, FTP Binary vs. ASCII, domains, etc. They're still going to need professionals to keep their network up and running, or they're going to need to learn how the tool they're using works.

>There are no easily installed or used software solutions for the teacher who wanted to use Atari computers on the Internet.
>
>There ARE on other platforms, including "an Intel box".

Again, define "easily installed." STiK is easy to install - if you know all the IP address and related information, you can install it easily - just like Netscape.

>Atari computers may still be useful in musical applications, and they make marvelous dumb terminals, but trying to use them for Internet connectivity is an inappropriate application.

Wow, that's a real good one. I'm putting that in my capture file of memorable quotes. "Internet connectivity on a TOS computer is 'inappropriate." Sorry,

Bob, but my clients (mostly small businesses) need to use the equipment that they have to come up with a solution. So do most schools.

One thing you haven't mentioned is the exhorbitant cost of consultants on the Windows platform, and the expensive tech support (via long distance or 900-number calls). A few years ago, a local user group here in New England helped a school set up their TOS machines in a network. User groups around the country would certainly be willing to do the same. The fact of the matter is, there are tremendous software and hardware resources available for TOS machines.To discount them all as useless is ludicrous. I recommend and sell TOS machines in applications I see as viable for them. If a client already has a TOS system, I do my best to make sure he can use it to do what he wants. This is a law of business. This is one reason why spending on schools soars while scores and results decline - many in the school are looking for an "easy" (albeit expensive) way to do everything. In this case, though, there's very little difference even in ease of use.

The Bentley Bear series and KidPRGS are great for the youngsters. ElCal
was essential to helping me through Probability and Statistics 2000 :').
Of course, with Mr. Sinclair's logic, that there's no software from TOS,
he probably thinks that all we do is put new wallpaper on the desktop and
sneak out to CompUSA to access the Internet, since TOS internet software
is so inferior. :')

Please remember that Mr. Sinclair has never used a TOS machine for any length of time, and that he couldn't tell TOS users what the basic purposes of the following well-known pieces of software are (he thinks no software exists).

OK, Peter, if you're out there, please tell us what the following software is/does, what the latest version is, and what its capabilities are:
-Papyrus
-Calamus SL
-DAS Picture
-DAS Layout
-Neon
-APEX Media Lite
-STalker
-Geneva
-MagiC
-LDW Power
-BEST
-KSpread
-Substation

BZZZZT! Wrong! Apex Media, Towers II, Moonspeeder, and Geneva won't run
under MagicMac. Not now, not ever! That's close to a 67& incompatibility
rate. I'd imagine that Spectre would attain a better compatibility with the
Mac titles you mentioned than the TOS equivalents I mentioned. This is more
proof that you have literally no idea what the TOS market is about. Please,
Peter, if you want to be taken seriously, make some valid points.

That's a red herring. We weren't discussing "superiority via emulation," we were discussing how usable computers are. Here's the sequence of events to refresh your memory:
-
1) You claimed TOS machines had no software, and gave a list of proprietary Mac titles as proof.
-
2) I retorted with a list of more or less equivalent proprietary TOS applications
to show what an illogical argument it was.
-
3) You claimed that a PowerMac running MagiC could run all the titles I listed.
-
4) You were proven incorrect.
-
I agree - Mac emulation under TOS stinks. But that's not the issue. Stick to the issues at hand.

IW II are still being sold? Ouch...Not on my school's price sheets.. Who the
hell would want a printer of that nature when color ink jets can be had for a
lot less?  I would advise your bookstore to dump those IW in the clearance
barrel..

: If you want, yes.. Through the Atari ST emulator..

If anyone thinks for one second that an ST emulator on PC, Mac or
whatever can run APEX media, then your brain must be as useful as bottled
fart gas. APEX runs on a dedicated RISC chip (namely the MC56001-DSP),
and you will need to emulate that to achieve such a task. I estimate it
would take a hell of a machine to software emulate such a piece of
silicon. Maybe an SGI Indy 2? Sorry, PPC mac and Pentium don't get close!!

However, the only problem with this on wintel clones is that netrape is about the best that they can come up with so far.

In fact, all of this: 'ST's can't do the Net' tripe has reignited my GEMulator interest precisely for that purpose (and bbs'ing).

True...But false considering the above minus the Amiga shine on the net..The net has opened resources to the classroom for instructional curriculum. The present platforms have the best tools to derive these resources except the ST and the Amiga(temp?)..

Unless you access the net through dial up..Many schools here access the net through netscape with dial up..

Many school districts that value education instead of football have technology coordinators that are responsible for the upkeepings..

And you think the ST would lower the cost? Currently the only ST available new
in NA is the Falcon..Which costs $1300 for low configuration.. 040 Macs can be
had new for $500..

Codswollop!! Why are there so many of us Atari users on the net then? WWW
is pile of account fee quadrupling bullshit anyhow, but we can still do
that if needs be...

In saying that Internet is 'Inappropriate...' for Atari, I guess you
could also say that toilet tissue is inappropriate for toilets. I should
hope that you have lots of toilet tissue at your end of the wire to mop
up the dribble though...

Define best tools. Ive been reading a lot of pap on the net about "which
machines have the best tools." Netscape is "one of the best tools?" What
about tools for accessing gopher, ftp, etc.? Internet does not equal WWW.
Re: Internet access on Amiga The Internet WWW browser that AT has released
looks great. Ive got several associates currently using it. So again, your

logic is skewed.

>Unless you access the net through dial up..Many schools here access the net
>through netscape with dial up..

First of all, I doubt that most schools"use dial-up, but assuming its true,
TCP-IP, WinSOCK, and assocaited protocols are still involved - a knowledge
of these is essential. If by "dial-up connection", you mean SLIP or PPP,
the points remain valid.

>Many school districts that value education instead of football have technology
>coordinators that are responsible for the upkeepings..

Exactly, which is why the "it needs to be remarkably easy to use" argument
flies out the window. In any case, the TOS platform is quite usable on the
Internet.

>>I don't understand where you are coming from here. Firstly, use of Netscape is a little bit more complicated than just clicking on "Install."<<

Not very much. Far easier than ANY Internet applications I've ever seen for an ST.

>>Installation of WinSOCK or Lizard is hellish.<<

I just watched a girl in an office near mine install Trumpet WinSock and Netscape, type in her DNS and email addresses, and she was up on the WWW in 15 minutes without ever breaking a sweat. She didn't have to learn anything about the computer or OS or compilers.

>>Eventually, any user of any computer is going to have problems.<<

True enough, but why handicap them with an obsolete platform to begin with? The girl in my office has dozens of people to turn to for help. I'm the only one who knows anything about STs, and she wouldn't know that.. she'd be lost with an Atari.

>Why are Netscape's features not supported additionally while compatibility
>with other browsers is kept up? Just coincidence?

I don't find that to be true at all.

I find far more sites using the newest versions of Netscape's extensions to HTML than sites which pout and stick their tounges out and refuse to support them.

"Compatibility with other browsers" MEANS compatiblity with Netscape anyway, as most browsers are eagerly adding the features that will bring them up to Netscape's capabilities.

Netscape is pushing the envelope... and suddenly that's a "bad thing"..?

I don't think so.

I'd be interested in knowing if that school is still using Atari computers for anything at all.

"A few years ago", I used to take my Atari 800 to schools and demonstrate what a personal computer could do. While I could still show off the basic applications that are available on that system, there's no way I could use it to demonstrate the kinds of things which are CURRENTLY in the mainstream of computer applications.

It's been my experience that trying to support an obsolete computer system is an exercise in futilty, and one which will not last very long before the system is replaced by current technology.

There are PTA (or PTO) groups which will hold bake sales to buy modern computers for teachers if the school system can't afford them.

It makes no sense to handicap teachers with obsolete or difficult to use tools.

The Atari ST is an obsolete and (compared with other platforms) difficult to use platform for this particular application.

Any platform one feels the dire need to run Netscape on, for Netscape
is a system hog and will bring down even some UNIX platforms.

If you are willing to admit that Netscape is not the only NET solution,
then system requirements have the potential to decrease dramatically.

STOP Spreading LIES!
NO programming skills are required.

STOP Spreading LIES!
Teachers are IDLE for 1/4 of the year (presuming they're not
involved in summer school). This gives them plenty of time to assimilate
new material.

>computers just because you think it would be cheaper...
>
>Do you want kids who know how to read, or teachers who can "make"
>obsolete text browsers..?

STOP spreading LIES!

To the rest of the world, 'make' might actually appear to require the requisite knowledge that the name implies. By attempting to say that it does, when you have been corrected down to the decimal shows that you have no interest in either truth or reality.

The TRUTH is that MAKE and SETUP are functional equivalents.

If your grasp of reality weren't so fragile you might be able to acknowledge this.

Furthermore: any teacher who isn't straight out of college will likely have had extensive command line shell experience. The PC's you are so fond of have only adopted the GUI (generally) relatively recently. So, any teacher with experience will likely have it in AppleDOS, or in the best case MS-DOS.

Also, put up or shut up. If you have a cadre of relevant teacher testimony, post their email addresses.

So, you're saying that CAB will run only under an ST/MT enviroment?

Bummer. The added overhead of that might actually give Bobby's arguments
some creedence.

However, a spawn() is not a multitasking call to begin with.

>
>> Also, the web is connectionless so: exiting CAB for what ever reason to

The network layer.
CAB is the application layer.
If they are one in the same, then CAB is kinda fucked up.
Is this the case?
I would presume that any ST tcp stack would be implemented as an accessory.

Nevermind that the physical connection is transparent wrt to http.
Have you actually ever used a web browser?

Sweetheart, I am not going to buy a TT in the near future. And there are TTs with CPU daughterboards (the early ones). If I get a Pentium PC, I can easily upgrade the CPU e.g. from 75 to 166 MHz. I can also upgrade a 7500 in a very similar way, but not a 7200.

: I know I am wrong, but I do love my TT for being the first major computer
: I bought out of my own money. ahh well horses for courses

You're not wrong by much. In a 'real' world test performed by my TT owning friend, (4meg ST/4meg TT RAM) who compiled POV Ray 2.2 for himself and compared render times on the same scene file at the same (sizeable) resolution, we found that his TT was matching 486DX50 machines with more RAM. That to me says that the 68030/68882 pairing, given 32-bit wide RAM access (TT-ram) is actually faster at a given clock speed than a 486DX chip. Imagine how much quicker the 68040 is than a 486DX. 040 is reputed to command thrice the grunt of the 030/882 at the same clock frequency!! Food for thought eh?...

: slow, I think it is time for a new machine-a PowerHouse. Unfortuently

Several accelerator boards exist for the Falcon. Perhaps the quickest of these is the Afterburner040. It has been benchmarked at 14 times the speed of a standard Falcon. That will give you good render times in comparison to newer PC/Macs. Don't write off the DSP either. Black Scorpion Software,

companies who write D2D software and numerous others have already shown us
just how stupidly fast the 24-bit DSP can hurl numbers around...

Oh, accelerators are "planned obsolesence," now, Peter? Nice try at a
comeback, but it doesn't cut the mustard. The individual in question
wwanted to know about new Falcons hitting the street. I answered his
question. There is a difference between someone wanting to buy an
upgrade from an amazing computer like the Falcon to an even better computer
like the Falcon MKX, and someone buying a boring Mac 7200 which will
be incapable of running CHRP/PPCP/PRep/whatever it's called (which Apple
planned to make obsolete to force an upgrade to PPCP). In one case, the
individual wants an even better computer than he's running now, in the other
case, the consumer gets stuck with expensive hardware without a future.

Atari doesn't make Falcons anymore, so we needn't worry about Tramiel
vapourware. The companies showing the new machines were C-LAB (who own a
license to produce Falcons) with the MKX, and Medusa with the Hades. Both
companies are excellent producers of hardware, and have a reputation of
delivering on promises and making solid hardware.

>Again, I'm not saying the ST is completely useless, just not applicable to
>the normal classroom environment.
>
>In the situation in question, that of "using the Internet" (which to most
>people currently translates to "browsing the World Wide Web", undoubtedly
Mass ignorance does not suddenly make the rest of the world right,
regardless of how big the mass.
>including the teacher in the original article which started this thread),

> the PC is *orders of magnitude* easier to use than an ST.

PC's aren't even a magnitude easier to use than commie command mode. Most ST/GEM software consists of nothing more than unarcing it.

>
> To install Netscape, you just click on "Install".

This is gross oversimplification and the same order of FUD (as the newspaper article). Setting up the TCP stack is the hard part of any machine. That is fairly much a constant (but linux is a pain).

The ST might actually be simpler since there is nothing to configure wrt hardware & the OS. Configurability is a double edged sword.

Nevermind that the machines that the school would likely be able to afford would barf all over Netscape (and anything else more recent). Nevermind that Netscape is still a buggy piece of shit even when it is running on a decent machine (it is worth it's 'selling' price).

>
> To install any of the ST "WWW solutions" you have to be a cross between a computer geek and a rocket scientist. And even when you get them running, the ST itself simply cannot match the performance of a relatively inexpensive PC... the kind school systems can afford. A teacher just can't afford the time

If Lynx is available on your shell account, even YOU could manage to set it up. Perhaps if you spent less time slagging those of us who have learned the necessary information for the domain in question and actually learning it yourself. These simple tasks may seem less daunting.

Step one: plug in the modem
Step two: insert ST language disk
Step three: turn the machine on
Step four: select the vt52 emulator from the accessories menu
Step five: dial the number, login, & run any unix curses software you
    bloody well please.

This insistence that the client do everything is rather absurd.

> necessary to research an obsolete computer system. And if there's no "computer

The essential elements of all computers (at least the ones that YOU would know about) are identical. Such efforts would not be entirely for naught.

>guru" teacher in the building who CAN take the time to "tinker" with an
>"off the wall" computer, the teacher (like the one in the picture in the
>original article) is stuck.

Such resourcefulness explains the state of our schools.

Once again, you appear to be totally ignorant of the ST's capacities. HTML might be a sticky point, however, the ST is quite capable of handling your 'pretty pictures'.

And as has been said before: libraries and encyclopedias seem to be out of style (not that they ever really were).

>
>There's a world of useful and interesting information, just perfect for a

>
>IF you have the hardware and software that can take advantage of it.
>
>And unfortunately, as the original article stated, the Atari computer can NOT
>be part of it all.

Once again untrue. It trails off at the bleeding edge but, it is still useful. As long as system independent standards are adhered to ataris' are quite capable.

Although they may be a poor choice for a new aquisition, they are quite usuable if they happen to be the hardware at hand.

This is not merely an ST bias. A old VAX and a few DEC terminals could access most of the same information equally as well. It just wont be the same pretty picture book as the Netscape setup would be.

Furthermore, the connection bandwith that would likely be available to any cash strapped institution would be insignificant compared with even ST speeds. All those pretty jpegs will be tied up on the phone line giving whatever machine plenty of time to decode.

Thank you..!

You've just confirmed what I've been saying. Only a computer geek rocket scientist can make an ST work on the Internet, and below expectations at that..!

We're talking about a teacher in a normal classroom, with a normal school budget and the normal (nonexistant) amount of time to futz with something like this.

In that situation (the one that started this thread), an Atari is a deadend.

BobR

>It can be "easily upgraded," eh? Please define "easily."

"Easily" means it can be upgraded with commonly available and inexpensive components which can be added to the system without having to have knowledge of digital electronics and soldering skills (as upgrading most Atari computers requires).

It also means it can be upgraded far beyond its original capacity (unlike most Atari models) and can be done a little at a time as budgetary constraints allow.

"Easily upgradable" also includes software... new system sofware can be added without having to hack and slash the hardware to solder adapter boards into the motherboard, and software upgrades are available at many, many local stores from companies which are still in business.

> : I bought out of my own money. ahh well horses for courses

386/33 is 5 MIPS
030/33 is 5.5 MIPS

486 DX2/66 is 44 MIPS
040/66 ("DX2") is 49 MIPS

Pentium 60 is supposedly 100MIPS

So, the 386/030 comparison is more valid.
Likewise 040/486 is a more valid comparison.

> You're not wrong by much. In a 'real' world test performed by my TT owning friend, (4meg ST/4meg TT RAM) who compiled POV Ray 2.2 for himself and compared render times on the same scene file at the same (sizeable) resolution, we found that his TT was matching 486DX50 machines with more RAM. That to me says that the 68030/68882 pairing, given 32-bit wide RAM access (TT-ram) is actually faster at a given clock speed than a 486DX chip. Imagine how much quicker the 68040 is than a 486DX. 040 is reputed to command thrice the grunt of the 030/882 at the same clock frequency!! Food for thought eh?...

Was that a _GENUINE_ DX50, or a clock-doubled DX2 25/50.

The genuine DX50 is faster by about 5% than the clock doubled DX2 version. And RARER.

The Intel FPUs are crap. Floating point ops are all done as a stack of numbers, and can only be done on the topmost item in the stack. So half the time is spent just juggling the values to the right posityion on the stack. Can you say "Intel Insane"?

Motorola 6888x FPUs, however, are register based, so they can access numbers as fast as the FPU can go. No juggling required. HOORAY!!

So, raytracing (which I believe uses a _LOT_ of floating point numbers, and hence is ideally suited for an FPU) would be faster on _any_ register based FPU.

486's (ie SX, SX2, DX, DX2, DX3, and DX4) all have 32-bit RAM access, unless you buy a "$50 if you send in 20 (breakfast cereal #32) box tops" model.

The 040/030 ratio is nearer to 4:1.

The sluggishness in the Wintel machine is due to a [crap] CPU instruction set, and a [even more crap] OS.

(Rumours in another newsgroup have it that Intel gets a kickback from M$ for every processor sold. And that every one sold must have an M$ OS bundled. But there hasn't been any conclusive proof provided, yet)

> The Question: Why aren't I using an Intel machine/Micro$oft OS?

BobR,
I would think that a school would hire someone to set up a cluster
of computers and that each individual teacher would not set up
their own computers to use the Net. My old high school had a
computer teacher. This was without any kind of Internet access.
I don't think your point about individual teachers makes much
sense. A dedicated computer user (like a school would most likely
have) could easily set up one Linux system. Besides, the money
saved on buying a cluster of STs (and a Falcon or TT to run Linux)
would easily pay for the installation fee.
Just yesterday I was reading pop mail (Oasis) which also gives people
nice access to netnews (with a slip connection). This package
will eventually have a Web browser. I also used STiK/CAB which,
though not stable enough yet, still allowed me to load a few pages
and cruise to Net with options for graphics. This package will
most likely soon be stable and is already easy to set up. I also
used Lynx browsing via VT-100 emulation. I am not sure what I am
missing as far as the Internet. Oh, and I am not a rocket scientist.

Oh phulease.. The Falcon has to be hacked to be upgraded and will be quite
expensive.. Can the falcon be upgraded to PPCP? I know the answer..

You only need PPCP if you need to run multiple OS's. Currently there are
solutions to run multiple OS's on non PPCP...

The 7200 is expensive hardware without a future..Last I checked will run
Copland. 7200/75 is $999 with 4xcdrom.. A slow 030
Falcon is $1299 last time I checked.. The Falcon with acc. board is expensive
and slow compared to the $999 7200! Amazing that one would want a platform
that is a poor engine for the internet..

What a load of crap! What new ed software requires 'tommorrows' computer? Millions of Apple II's are still being utilised in the classrooms and still serving the needs.. Considering it's 20 year technology..

Are schools suppose to use the ST platform that has virtualy no software and quite useless?

>
> I see this trend in schools here in New Zealand. Teachers here in New
> Zealand are complaining about wages. Little wonder, with 1/4 of the bulk

Technology moves on..Unlike the ST were the hardware and software stay the same year after year. School media centers have to weed at least ten percent of the collection to make room for the new..

My library buys tens of PC's and Macs annual to keep updated and the previous ones are recycled down the line. 286 and 386 machines are still in use and productive..

JEDIDIAH blatherd a whole lot more BS than I care to bother quoting at the moment...

The most prevalent theme however is that he completely missed the entire point of this "discussion".

I've already agreed that computer geeks and rocket scientists can use STs to "access the Internet", but that's not the point here.

In the context of the original question, the Atari ST is virtually useless.

That's a bug of the Web pages in question. Any browser omits commands it
doesn't understand or is unable to perform, so if the page is unusable
afterwards, it was badly designed, in most cases special features of
Netscape are the reason for those errors. And an ST can handle 8 bit
pictures if equipped with enough RAM. Ever heard of the Floyd-Steinberg
dithering algorithm?

RBerry's TAX-TIME CLEARANCE AUCTION
Classic n' Rare ATARI and VECTREX blowout!
Much as I hate to do it, I've got to get rid of this
stuff to help out with taxes and my new house,
AND A NEW BABY! YAY
Please bid away! All games are in nice shape
and a part of my collection I need to liquidate.
I'll be sending an e-mail update daily to all
those who request.

I've also got the eternally elusive (CRAZY
CLIMBER) from the orignal owner for bid.
(Please see details below!)

Take note of Frogger II 3 Deep and some other cool hard to finds within like Shuttle Orbiter, XONOX games, and other treats. Also remember that many of these games have instructions, too, with no added charge, as indicated with a "+" sign next to them.

Shipping is 50 cents per cartridge, and I'll accept all forms of payment save credit card. (Of course, I'll wait for checks to clear, first). Minimum bid for cartridges is $1.00, and all raises must be in $1.00 increments. Updates will be posted daily, as long as they are sent to:

fzgd51a@prodigy.com

Bidding ends on April 10th, 1996, so hurry on up now! Payment will be sent to

Robert A Berry
221 Reamer Street
Auburn, CA 95603

Please, no trades desired.
Here we go!

*************!!!!CRAZY CLIMBER!!!!*********************

Yes, it's one of the most desirable and sought after ATARI produced cartridges ever. This is the real deal, ordered way back when from the ATARI AGE club way back when (this was the only way you could ever get this game, as it was never produced for direct sale) I'm selling it for the original owner. Minimum bid is $75 and I'll pay to have it sent via Federal Express to ensure you get it just fine. It works just fine, and is the only adaptation of this classic Arcade to ever appear on any system. Don't miss out on this rare chance to own CRAZY CLIMBER!

Minimum Bid $75.00

>Yoiu _needed_ pictures of dragonflys?

Yes.. I was specifically looking for pictures. In the search I turned up pictures of not only dragonflys but related orders of insects.

A stock, unmodified ST, such as the teacher in the story undoubtedly has, would not be able to display the pictures in their original form, and would display them VERY poorly when reduced in resolution and dithered down to 16 colors.

The problems in displaying formatted pages I was referring to are caused by the ST's inability to display the fonts and layouts at the original resolution. It's true that a browser can omit anything it doesn't understand, but you end up with a far different display than the intended original.

>To install lynx, just type "make".

That's an order of magnitude more difficult than installing a PC
program like Netscape.

You don't just turn on your ST and type "make"... you first have to know
about compilers and programming and rocket science.

With a PC you put the Netscape disk in the drive and click on "install".
Period.

Teachers have enough to worry about without having to become programmers just
to run a net browser.

Quit spreading lies.

1) Generally upgrading an ST is not necessary
2) Most upgrades are a matter of plugging in new hardware
3) That hardware usually plugs into a PC or Mac in precisely the same manner

A) upgrading a PC is not trivial
B) if anything is rocket science, getting rid of IRQ, DMA and base address conflicts is.
C) older bus standards are getting less and less support to the point of being near orphans.
D) not all motherboards are created equal

>
>It also means it can be upgraded far beyond its original capacity (unlike

>allow.

Quit Spreading LIES.
Such an upgrade will likely leave nothing left of the orginal computer
but the case.

```
>
>"Easily upgradable" also includes software... new system sofware can be

   Quit Spreading LIES.

   Some of the hardware that you were refering to earlier in this thread simply
   wont run new software well if at all. Netscape barfs on a 486DX/33 let alone
   anything actually OLD.

   In order to get around this, one would have to invoke the upgrade path
   that equates into building your own PC that you are so fond of.

At this time, you said it when you said "MagiC Mac seems to be a golden
opertunity", if you currently own a Mac. Clones are on their way but
in the mean time pile up on all the new software for Ataris. If you don't,
a clone won't mean a thing without it. Remember how long it took for the
Falcon to finally arrive, and Atari was no small company. The companies
involved in the "clones" are small and specialized.
Expect good news for TOS users in the very near future. In the mean
time, buy as much as you can.

Aahh, that explains some things. I saw in various processor spec
lists that the x87 coprocessors perform _quite_ more FLOPS than the
an 68882. (About an _order_ of magnitude, IIRC). I never understood
why 882s seemed to perform much better in real life applications
anyway. Thanks for your explanation! You made my day.

BTW, the FPU in an 040 is, again, about an order of magnitude faster
than an 882, IIRC. Unless, of course, one makes heavy use of the ops
that are not implemented (and have to be emulated).

This is precisely the attitude that bugs me. A home PC is NOT an 'internet engine'. It is merely the steering wheel. The servers that you are not acknowledging are the engines. Most of them are Unix. Unix can be connected to with a simple cursor addressable terminal (ST, Dec Terminal, PC running Telix, Windows running Terminal). Let the REAL machine do all the work and you don't really need anything at home. Considering that the thruput of current modems are trivial even compared to 10 year old ST's, one has to wonder what Netscape is doing with itself when it sends CPU utilization up to 100%...

>The Mac/PC have newswatcher and Netscape navigator for use on the internet..
>None of this half baked, one quarter working stuff.

Netscape is half baked, one quarter working stuff.

However, the real question isn't does the ST have a graphical browser.
The real question is why do a significant group of people wish to ignore
the fact that Unix shell accounts give access to the whole internet
quite independent of the hardware you might have at home.

It seems that a significant group of people don't like the idea that

```
     some bloke with a TI/99 could have the same access to the net as they
     do (with their mighty Pentia & PowerPC's).

  If you are more than content to admit that YOU are too STUPID to
    run an application ON ANY PLATFORM, then that is that.

   'Cause that's all that is needed for ANY machine to access the net is
   a modem and a terminal emulator. A TI/99 can do it, a Timex sinclair
   can do it, and a 30 year old dumb terminal could do it.

>In the context of the original question, the Atari ST is virtually useless.

Quit spreading lies.
Buy a clue from somewhere. ST's are quite capable of displaying 512 colours.

>
>The problems in displaying formatted pages I was referring to are caused by
>the ST's inability to display the fonts and layouts at the original

Quit spreading lies.
That is all there is to it.

>
>You don't just turn on your ST and type "make"... you first have to know
>about compilers and programming and rocket science.

Quit spreading lies.
Typing %make requires no understaning, merely the ability to follow
one REALLY SIMPLE INSTRUCTION.

>
>With a PC you put the Netscape disk in the drive and click on "install".
>Period.

Quit spreading lies.
The network has to be set up first. This is a lot more difficult than configuring any terminal.

>
>Teachers have enough to worry about without having to become programmers just
>to run a net browser.

Quit spreading lies.
Any moron can type make. You even managed it a few times in the post above.

FOR SALE

* 1040STf *

720K Internal Drive
TOS 1.4 ("Rainbow TOS")
2.5mb RAM (Upgradable to 4mb)
Z-Keys
IBM (External) Keyboard included!
Tweety Board!! (For "Stereo" sound)
Original Box
Power cable
Z-Keys Documentation
Great Condition!!
NOTE: This computer has the nicest, CLEANEST upgrades to it that I
have ever seen.
***** For $20 (If I have the chips straight) this can be upgraded to
4mb, threw B & C ComputerVisions.

Asking $200 + shipping

* Futures Systems 3.5" floppy drive model GTS-100 *

External double sided drive
Power Supply
Full black case
Good Condition
LED display
These types of drives work exellently!!
Asking $50 + Shipping

** OR ** OR ** OR ** OR ** OR ** OR ** OR ** OR ** OR ** OR ** OR **

If you buy both items... I'll throw in (FOR FREE) at your discretion:

* Magazines *

(10) Current Notes Magazines

* Chips *

PAL chip. Came out of the Mega Ste, still works! (Replaced it, even thought I didn't need to. Didn't know that at the time. So I have a spare here) And this one will support the high density drive!
Number is: C301901-002.

Floppy Drive Controller Chip. Still works! Just upgraded to the AJAX chip, so I don't need this one! The number is: WD1772-PH

Tos 2.05. Works great. Just upgraded the Mega STe to TOS 2.06!
TOS 2.05 will work in an STe!

* Joysticks *

(6) Misc Joysticks

* Covers *

Covers for an atari Monitor, 520ST, and the external atari floppy drive. In new condition, except for the monitor cover.

If you have any questions, or your interested in one of the items listed above, PLEASE Email me! If you respond here, PLEASE keep the same title so that I can easily find it.... Thank you!

Well, or may be it is because Netscape has features other's do not? I'm not arguing the usefullness of those features, just that if you want X on your page, you have to user Netscape's features.

\>Monopolies _must_ be fought, Netscape _is_ building a monopoly. There's

Shame on your very close friend for choosing to own a pet for which there
is no shop within 200 miles, and for which support is only available via
the internet.

No, no, NOOOO!!!! Buy a Mac and access the Internet through E-World. It's
so EASY. . . What? E-World's been killed?!?!?!?! You mean. . . no more
easy access? Gack! What do I do? These Macs are now worthless! I have to
learn wierd stuff like Mac TCP in order to hook up now! Oh, no!

Gimme a break. I never thought I'd see the day when a person would
vehemently argue that an Intel box is easier to use (particularly in
education) than even the weakest TOS machine.

If you want, yes.. Through the Atari ST emulator..

On the contrary... there's a Jack Russel Terrier breeder nearby, with on-site support only a phone call away.

She can buy software for "Tigger" at any pet store and he's been "upgraded" at the local vet. (Although he probably wouldn't agree...)

Thank God he didn't have to be mailed in to Severna Park, Maryland to get his collar changed..!

>I would like to know if I can plug an IDE Hard disk on my old atari ?

Depends on which "old atari" you have.

If you're talking about an ST, the answer is... no.

If you're talking about an 8bit Atari 800/130, the answer surprisingly is yes.

The setup I'd read about unfortunately has the peculiarity of only storing half the rated capacity of the drive (apparently it transfers only 8 bit words instead of 16 bits), but it works.

(For the purists, there IS supposed to be an IDE interface for the ST... it's from Germany and is about as easy to obtain as the Holy Grail and the Golden Fleece.)

>Quit spreading lies.

Oh well... I see Jed wants to pull this down to a personal level...

Guess what, Jed... piss off.

Learn to stick to the subject, and learn a little about Atari computers, then learn to get along with people. Then try learning to read, and understand what people are typing to you. Then piss off.

You still haven't provided a genuine way the teacher in the original newspaper article can use an Atari computer on the Internet in a normal classroom situation.

All you've shown is that you're a computer geek with no social skills.

Oh and yes.. an Atari can display 512 colors (actually they can display more, but I won't embarass you by mentioning that), but it can't do anything else while it's displaying them, and ONLY if the picture was created with a special Atari-only graphics program, which makes it completely worthless in the current situation under discussion.

By the way, piss off.

Get real. Much as I hate to say something that backs up the prize twerp
Sinclap, you claim that running CAB, instead of Netscape, is an _advantage_.
That's the most ridiculous claim I've heard in ages.

|
So many misconceptions, so little time...

You wont embarass me by mentioning an ST format with better colour depth.
They would be quite superfluous as the question was displaying 256 colour
pictures. Pallette flipping is more than adequate for that.

Also, regarding that the ST cant do anything else while displaying a
spectre pic... You obviously havent seen a PC sans FPU trying to decode
a jpeg. Netscape in general also hogs the a PC in an ST like manner (in
general also) when displaying pics.

Nevermind you are neglecting the comms thruput issue once again as well.

Also, your assertion that a special program need create a spectre file
is just plain wrong. You are either really stupid or an even bigger liar
than I thought you were. An ST could convert between GIF & SPC in memory

if necessary and display any 8-bit image you could throw at it (size being a problem of course).

There are other ways to approach the problem. However, you dont seem to approve of diversity of approach.

|By the way, piss off.

Sorry, can't do that.
As long as you continue to spread your manure,
I'll be here to post corrections.

You cannot use an IDE drive on your old Atari computer - SCSI drives are recommended and pretty cheap these days.

Our difference of opinion is that I like trinitron tubes. Sony monitors
are a bit better but they are more expensive than Apple's at the same
size. My favorite brand is the Radius because they have great color,
a sharp picture and good software.

A friend of mine just bought a PowerPC 7500 (MAC, not PowerCurve) at the
excellent price of 3 700$(Cdn), that's about 2 700U$A. Of course the monitor,
keyboard, and mouse were extra. I suspect the price you have above is a
PowerCurve price?
I am NOT being sarcastic about the price, it is an excellent price, at least
500$ cheaper than other MAC dealers were sellling for.. He originally wanted
to go with a PC, and I was researching it for him. To get an equivalent
machine it would have cost him less than the PowerPC, but it was only 500$
less, and the PowerPC technology is much better than the intel tech. and as a
professional graphic artist the MAC is a better idea, for creating, for
dealing with service bureaus.
I love my Falcon, and I consider the powerPC to
be the Falcon of the mid nineties and if I were
buying right now, I would probably get a PowerPC, and install MACMagic so I
could run all my excellent Atari software.

>This is my own opinion..Did I ruffle your feathers...

Don't flatter yourself.  The only thing that astounds me is
your ignorance.

>Whats there to talk about Atari computers?  Make nice door stoppers and
>bookends..

More verbal diarrhea from the Sincrapper... haven't you noticed anything in
this group!?  People use Atari computers for many things, they
wouldn't still be owning and talking about them if they didn't have
a use for them.  Sheesh.

Besides, I still use my 130XE to play games.  Yes, the SAME 130XE
setup that I've had for 11 years now, and it's still quite reliable
and offers value.

Let me know when you've used one of your Macs for 11 years, dork.

/Kevin

Sure, I'll be happy to. For example, the standard for connecting keyboards and mice to Macintosh computers is called the Apple Desktop Bus, ADB. :-)

However, external connections to other machines (like a modem or ethernet) are not called busses-- the term only applies to data paths within a single machine, at least as far as the "standard usage" of the word is concerned....

Snap !! , I also have 16MB of RAM. Yet in my 'computer' job I require Word4Win,
EXceed X term
emulator, network access for a file sever (Novell), TCP/IP connection, TN3270

mainframe
connection. I also use Teamlinks e-mail, though this does kill the system and
resources. All
I know is that when using some/all of the above the system seems to access the
disk a lot, even
though the software is pulled from the network file server.

>Ever hear the of the term "cache"? My disk controller has one, Windows
>has one and the motherboard has one.

Yep. I'm not sure my DELL 450/L has disk controller, Windows has one .. you me
smartdrv?

>These are pretty simple concepts we're talking about, used by both systems.
>I wish people would crack open a book before they post!

I am aware of these concepts, but it doesn't alter my argument that only one
device can use the
BUS at the same time. Cache, buffering etc are only workarounds.

Andy.

If anyone out there has any information on chess
games for the atari 2600, I'd be eternally (as in
forever) grateful to them if they could mail it
to me. I'm looking to buy a chess game for the 2600, for various
and sundry reasons that I'd rather not explain,but
are sort of personal, if you get my drift (but no...
not like that... get your minds out of the gutter..)
Thank you very mcuh for any help and for ignoring
that gross typo.

Brian

Infact I have. It masters the BUS , therefore the CPU is pushed out of it.

> ... PCI-to-PCI transfers?

Yep , again the CPU doesn't have access to the bus _at the same time_

>Cache (wow, there's a new concept!)? Write buffers? Or, let alone,
>dsiconnect-reconnect?
> ...

Again yep, and again the BUS is used by one or the other not BOTH. These just let the HW continue whilst something else uses the BUS. It still doesn't allow both to use the bus.

> ...
>Or, to put it differently, why can I pull 8M/s from my harddisk, and

Clinton Keith <clint@angel.com> wrote:

>There's always going to be some limit to the number of apps you can run for
>any given amount of memory.

Yep agreed, but windows seems to run fewer on the same amount of memory than other

desktop
systems available (sometimes on other CPU platforms). Hence my point on some
people reaction
to windows when they come from other more �efficient� systems.

  The only solution for any platform is to add more
>memory. I remember that earlier versions of Photoshop would handle memory and
>disk caching poorly, so one of your apps could be to blame. Also, your virtual
>memory settings could be screwed up.

Don�t know, I have 16Mb RAM, 25Mb Virtual, 2Mb Smartdrv cache. Any suggestions?

>>>These are pretty simple concepts we're talking about, used by both systems.
>>>I wish people would crack open a book before they post!
>>
>>I am aware of these concepts, but it doesn't alter my argument that only one
device can use the
>>BUS at the same time. Cache, buffering etc are only workarounds.
>>
>But the purpose for your argument was to claim that Windows was screwed up for

No, the purpose of my original argument was it indicate why some (amiga) owners
may �hate�
windows. I gave the example of disk swapping , in the _context_ of _my_
experience with
windows, as to a possible reason. Not as a general statement on all OS�s
interaction with HW.

>cacheing memory on the drive to begin with. Cacheing is a way for resources to
>be used beyond their physical limitations and if you use more memory
>than you have on silicon, you can hardly blame the OS for slowing down.
>
>Of course cacheing is "workaround". No computer has a disk drive that is even
>within a magnitude of the speed of memory chips. However the cost of memory
chips
>well beyond a magnitude higher than disks in price/megabyte. This is the whole
>purpose of cacheing. Cacheing is a way of extending resources cheaply. If you
>want the faster speed...buy more memory.

My point exactly! It also seems to be MS�s attitude of �yes it runs on 386 with
4MB� but if
you want to do anything with it then �buy more�. Refer the original statement
that amiga users
hate windows. Could it be that to get it to do anything useful you need more
resources than
other systems. And no I don�t have examples, but it seems from mags, media and
newsgroups most
people think windows is bloated.

>Also, refer to some of the replies here about the bus arguments. I won't repeat
>them since they are pretty good, but the basic premise is that there are several
>busses on your system. They are not being used to full capacity and they have
>local caches to handle bottlenecks. Bus contention is NOT the main problem with

>virtual memory. Drive speed is.

Yes, but does Win3.1 allow one process to continue whilst another is using the disk (or some
other HW with cache, bus, buffer, etc). My understanding is it doesn�t and one process
excludes all others from the HW. I know that not all mutlitasking systems works this way,
refer to another reply I made in this thread which states the _system_ I use at work. It seems
just co-op types such as win3.1. All the examples people have used to prove me wrong (?) are
pre-emptive types.

As I said elsewhere, maybe I should have said "In my experience under DOS/
Win3.1 ...."

Andy

keywords: internet, atari, NetDay, San Jose Mercury News
newsgroups: comp.sys.atari.advocacy
summary: Strange photo and caption

On page 22a of the San Jose Mercury News for Thursday, March 7, 1996, there's a (big, color) picture of a worker holding a monitor in her lap, with a couple of tables holding several atari computers.

The caption under the photo reads ``Meagan Azevedo, project specialist at San Jose's Santee School, has a room full of Atari computers. None of them can be linked to the Internet, which means Santee won't be participating in NetDay.'' {NetDay is of course this big volunteer effort to connect all the schools in the US to the internet.}

I was really surprised by this---don't ataris have serial ports? Couldn't they at least use them like dumb terminals and hook them to a PC running linux or something similar to get some multiplexed internet access?

Anyhow, it seems that someone is making a mistake---either the school, the Mercury News---or of course me. Maybe it really is impossible to use a room of ataris to connect to the internet---but that sure seems strange.

As I sent the previous message, I looked across the office and to see someone using a PowerBook Mac and though 'I know what your going to reply'.
Sure enough you quote the MAC above. It was just an off the cuff remark. And yes, the person using the MAC doesn't work for us, he's on secondment. But even his company is forcing him onto a portable PC which of course he's fighting tooth and nail to aviod because he's seen our Win3.1 systems.

Andy.

Probably micro$oft or someone paid them to write that. :) (ataris are certainly quite internet-connectable, via the ways you described, over tcp/ip if they're newer or, if they're 020+ with FPU, running linux/X.

     Or if you just want a shell account: using the vt52 accessory.
     This worked for me for years on the ST long before the current
     hype and fad. Also, for certain tasks, I prefer to do this with the
     PC as there is no packet overhead (procomm).

Just fuck off. It's obvious you have no clue.

"You need a P-100 to run Win95"
"Apple Computers are cheap and reasonably priced"
"You actually have a wide choice of Operating Systems on a Mac"
+ referring to IBM clones as 'wintel' machines (when you can get a variety of
OSs and CPUs, in reality) + just being a dick and not admitting when you
are wrong. And not letting this discussion die. It's obvious you're
a Mac zealot, so why I have even bothered up to this point...

I don't have a clue? I refuted your lies that Macs cost more than equivelant
Pentiums. I provided evidence to the contrary and you blow it off by talking
about monitors and so on..

Again. what part do you not UNDERSTAND?

>
> "You need a P-100 to run Win95"

My personal belief for acceptability..

> "Apple Computers are cheap and reasonably priced"

Yep..and I proved it. So what do you not UNDERSTAND? You side stepped my
proof by bringing in the PC oreinted Computer Shopper as evidence that is not
true..

> "You actually have a wide choice of Operating Systems on a Mac"

I never stated that. I stated that linux would be available as an option.
What sentence I used do you not UNDERSTAND?
>
 + referring to IBM clones as 'wintel' machines (when you can get a variety of

People who buy Powermacs obviously are going to use the Mac OS and will have
not have OS choice until Linux is available and when the CHRP hardware is out.

I proved your asertions wrong and you have to resort to sniffling and crying
and lashing out that I am wrong even thought you could not back up your
statement that Macs cost more. I proved you wrong...

Again, what part do you not UNDERSTAND?

>
> Rich

Fun making you an ass, Prick!!

Yeah, sure. I just can picture MicroSoft collectively spending sleepless nights,
thinking how can they make bad PR for Atari... B^)

Seriously, though, making Atari's internet-connectable might be an interesting
academic group project for Comp-Sci students, but not something a small school
would (or should) try. And then, Atari internet tolls are rather weak compared
with other platforms...

The above does not necessarily represent views of my employer,
my educational institution, or of myself.

<76702.1466@CompuServe.COM> writes:
||Maybe it really is impossible to use a room of ataris to connect to the
||internet---
|
|Depends on what you mean by "connect to the internet"...
|

There is a significant difference between 'connecting to the internet'
and buying into the overhyped flim-flap hype fad that seems to be
in vogue at the moment.

|Sure you can "connect" with just a modem and some software, but what level
|of usefulness are you expecting..?
What you fail to grasp is that information is information and
most of what falls into information is in deed available in
text.
|
|Forget about full color web browsers.. there aren't enough colors available
Actually, for stills, an ST running a browser in kiosk mode would be
perfectly fine.
|unless you're running an expensive Atari (and I doubt a school has a "room
|full" of Falcons or TTs with expensive video boards), same for the screen
|resolution.
Most PC's suitable for net-work are just as expensive as Falcons.
|
|Also, forget about going to the store and buying an inexpensive, easy to
|install program that would be suitable for use in a school environment, and
|which will be reliable and stable for kids to use.
Winsock apps reliable and stable? What planet are you from?
|
|Forget about networking the computers together or to a server for Internet
ST's have had networks for years. Has anyone ever tried hooking
up commcontrollers to ST's. And you dont need a bloody server for
internet access just clients. Even so, with linux gives one access
to all the internet tools you'll likely ever need with the capacity
to compile anything else that might come along.
|access, again unless you've got a room full of those expensive newer models
|and a lot of expensive (and barely existant) hardware and software.
|

The whole point of client-server is so that you dont do that.
A falcon or two as servers and the rest can by wyse60 terminals.

GNU is GNU everwhere...
|Text only browsing, or ASCII based newsgroup reading..? Sure.. no problem.
|

actuall, since newsgroups are nothing BUT ascii, a fairly dumb
terminal solution would actually be appropriate. Really, why add
all the overhead needed for superflouous bells and whistles.

Also, considering the speed of the most commonly owned connection,
text only browsers do have some merit. Admittedly they dont quite have
the flash of Netscape (which likes to eat itself frequently) but,
most of the flashy stuff on the web is way to slow for the kind of
connection most real schools can afford (real != mary chote (sp))

|I doubt that's what that teacher had in mind.
|

The teacher is probably as clueless as you are believing that the
entirety negates any of the parts and that maximal bloated solutions
are the only ones possible or even desirable.
|BobR

I agree. However, there is one problem: I for instance do not know what you
can do on a Power Mac. Therefor I can't possibly tell you what would make it
worth your while.
However, in atari.comp.sys.atari.st I found a lot of people using Macintosh
computers. Maybe they can help you?

Sander.

Wow!  It's real interesting to see such a full state of denial!  I suppose
that you don't use the GEM desktop or any other of those "overhyped flim-flap
hype fad [SIC]" desktops out there.  Hell, good old black-n-white binary
representations of data are good enough.  What the hell do you need all those
256 color images of data for?  Java?  What the hell good are
platform-independent OO languages?  Why should my kid run Netscape on a
donated 386 when the school system could buy Falcons?  When I was a kid,
and I wanted a word processor, I wrote my own!  I had to use ones and zeros!
Hell, sometimes I ran out of zeros and had to use the letter 'O'! *

CNK - A former 880/ST/TT owner

|| Oooohh... Installing linux... such a daunting task.
|
|Well, installing LINUX isn't that bad, but a) would it run on ST's they probably
|have, and b) it defenitely isn't as easy as running install program for Netscape
|and having everything available...
|
|Defenitely not something a school should have to do to connect to the net.

1) Getting the 3R's right first might be a more fruitful waste
of effort
2) The experience of getting linux up and running will likely
be much more educational than the net, especially the web.

|
|| And if you're more interested in information vs. data: just
|| run Vanterm.
|
|True, but tell it to countless idiots who insist on linking everythig through
|megabyte-sized imagemaps...
Well, that's the reall problem. Most of us have to deal with
a phone network that has a max thruput of 38K. That's why,
if it's available, I'll hit the text version of a page even
on a Pentium class machine.

For everything except the graphics side of the web, a shell

account is more than adequate. 2400bps will even suffice for
some of the less 'megabyte-size imagemaps' laden parts of the
net.

Ummm... I thought the TT has an fpu.. At least mine has, I think. Never really bothered to check. Just want to use it for STiK and Cab for Atari Support in company (still hasn't gotten it to work yet).

> >>Don't know as I use atari, but I'm sure it doesn't run out of memory as
> >>often as Win/PC.

There is third party software that does virtual memory for the Amiga (as have mentioned somewhere in previous post). I would never use it because of the way I use my amiga. I simply add more ram.

> O/S on decent H/W. They, along with me (and probably others) just wish for a decent O/S on decent H/W.

This part was solved years ago and argued many many times already.
(and I don't mean win4.0 or NT either)

> Windows locks up on a daily basis, though I've been running out of resources lately so maybe the problem is there. Opening and closing apps on Win3.1 does seem to loose sys resources.

Okay... What software do you run and how much RAM? If software is from reputable companies and you have 24-128Mb RAM, get NT and kiss goodby to the GPF. Seriously.

> Networking is another dept! But still, why can't Word allow me to keep typing whilst saving Excel? It all goes through WinSock, and therefore (I understand, but maybe not) windows is controlling access to the Novell TCP-IP. Not knowing sys-admin level stuff, its probably windows and related to its co-op nature. One program (see I have learnt something) hogging resources.

    Again, get WindowsNT, if you HAVE to use Excel.

Strange, I though if I used the term "your" machine in reply to a person, I didn't think it included everyone in the room, house, street, city, world that happened to overhear me.

If you (Bernie, and only Bernie) take you car (presumming you have one) to a garage and the machanic says to another customer "your cam shaft is bust" I guess you take it to also mean yours is also bust, I think NOT ;-))

One day I'll get the hang of this newgroups lark, it never ceases to amaze me (still green behind the ears) of how fast newsgroup discussions get off the subject. All quite stimulating to watch. The original query/statement I replied to was Win vs Amiga, never mentioned Linux.

I guess it's true, everyday you learn something new.

Andy.

(So enlighted its almost spiritual)

Well
I see nothing difficult about a room full of TT's running UNIX(Linux, et al)
and using xwindows (for Chimera, Netscape, whatever) and networking also.
16 colour, but faster screen redraws :^)
[cuz you're not trying to display 16 million colours, or even 256]
Ataris are versatile
they can emulate anything :^)

>>Actually, 10% seem far too high in that perspaective.

The world is rapidly being carved up and eventually every
consumer will be using a PC of sorts. Soon telephones and
televisions will be PC's. If things go according to plan, Gates
will be the one writing the operating system.

World conquest? I can see it happening.

I have an Atari Mega ST4 for sale, complete with 14" NEC Multisync II monitor, NEC P5200 24pin 360DPI printer, and tons of software.

Complete system: $500 obo.

To be able to say that with any confidence, I'd need to be much more
familiar with Mac software than I am now.

However I can state with complete confidence that if I were given a
PowerMac for my birthday (2 April, HINT HINT) the first thing to be
installed on it would be MagicMac. And that could be the last thing
for a long time: I'm not saying that Calamus, Omega, Apex Media etc.
are unbeatable, but I wouldn't go buying new software just for the
fun of it. I guess most sales of MagicMac fall into this category.

TT = 68030 @ 32Mhz CPU 32Mhz Motherboard + TOS (Agreed ... CRAP)
486-66 = 80486 @ 66Mhz CPU 32Mhz Motherboard (incl FPU) + Windows

The TT was no-faster or productive, but the CPU is running at half the speed
and doesn't includes the FPU. As I said, just think what you could do with a
decent OS on the faster (?) PC hardware.

I believe that Pure C was developed by a third party under licence, but got
bogged down in Legal wrangles. I use Lattice C on the Atari, but agree there
isn't much to touch the integrated development tools available on the PC.
Saying that, there are some good third party add on, but even these are not
integrated, what I'd give for a good integrated source level debugger.

Was I? I thought I was arguing that in my experience Windows was crap
(paraphrased) and I found it frustrating to use. Therefore amiga users may
feel the same having come from a pre-emtptive OS on limited H/W to a limited
O/S on decent H/W. They, along with me (and probably others) just wish for a
decent O/S on decent H/W.
Sorry, should have said, only ever used an Amiga as a door stop ;)

OK, typing error, meant programs.

>>Yeh, like why has the app I'm using f*** stopped again.
>>
>Mine usually don't I got less GPF's under 3.1 than those stupid bomb lockups
>under TOS.

Only ever get bombs on the atari when I run PD, very old apps , or progs I've
written myself and yet to debug properly.  I even use Geneva which provides
co-op multitasking without problems.
Windows locks up on a daily basis, though I've been running out of resources
lately so maybe the problem is there.  Opening and closing apps on Win3.1 does
seem to loose sys resources.
..
>If you are having problems with your network (and you did say you were using
>Novell) then look at the Novell software or your network architecture.

Networking is another dept!  But still, why can't Word allow me to keep typing
whilst saving Excel?  It all goes through WinSock, and therefore (I
understand, but maybe not) windows is controlling access to the Novell TCP-IP.
Not knowing sys-admin level stuff, its probably windows and related to its
co-op nature.  One program (see I have learnt something) hogging resources.

>Otherwise you should resort to running Excell and Word across a
>network on your Atari or Sun....hahaha. ;)

Now you're just taking the p**s ;(

> If the choice were mine, we would all be using Linux

Agreed, one day I might spend the money, then again, Jamacia looks good for a
holiday (Rum, Rum, Rum ....)

Andy.

I believe there are some cunning hardware hacks that mean this is not
necessarily so. However, most of the cache misses will not come during
DMA transfers, so the problem doesn't occur too often in practise
(except perhaps in very heavily loaded systems)

>>>> ... PCI-to-PCI transfers?

Yikes! What do you mean by a backplane? A large grounded sheet of
metal, or the component that connects the L2 cache controller (or
CPU) to the main memory?

> However, cache are not silver bullets. The cache will miss eventually.
> Considering that a CPU is 1000x faster than a disk, the time a disk

It is a broken architecture indeed where a disk writes directly to
main memory. The world has moved on a long way since then...

Yes, if there is bus contention, something must wait. However, this
mostly does not happen. The main alternative (dedicated connection
from every component to every other component) is frighteningly
complex and expensive...

> Not if windows is in fact on his machine.

Hardware differences matter a lot in this discussion. There are several different hardware configurations used in PCs, and the rest of us have no idea which particular one he has.

Win3.1 is not very good at making the most of the hardware it is running on; other OSs like Linux and (I presume) NT are much better. I can't comment on 95 except to say that I'm suspicious of it...

Donal.

What about the use of anti-ailiased fonts. This helps in making them much more easy to read - especially at small font sizes e.g. 8 or 10 point. Unfortunately the only system that I know whcih supports proper anti-aliasing (not the attempt made by the Win95 plus pack) is RiscOS. However it does make proof reading on screen much easier.

I've said before, we are looking at NT for development. Unfortunately we will
probably have
to run is on these 486DX2 50's with 16 Mb RAM. Who said this company's tight ;-)

Andy.

To All Customers and anyone reading this. My E-Mail is screwed up. I am not receiving my E-Mail and others I send E-Mail to are not receiving E-Mail from me. I know this for sure because, I have called several of my Customers and they confirmed this. Until this passes, the best way to reach me is by phone. If you send E-Mail to Bravo Sierra Computers and don't receive a reply in a week, call me (here in Oregon.) at (503)256-9974 Best time to reach me is 3 PM - Midnight, Monday - Thursday and Friday from 3 PM -

6 PM Pacific Standard Time. If I'm away from the phone, leave a message with
your Home Number and the Best time to reach you. If your calling from outside
the United States, I can't call you back, so Please, Try Again. Hopefully, my
E-Mail clears up soon. I wanted you to know so you didn't think I was
snubbing you.

Well, _I_ have learned to use just that. And I doubt teachers prefer the
pupils to just click. They'd better advise that kind of pupils to get AOL
access.

Well, you'd better ask the programmers of the respective virtual memory management software on Amiga and Atari whether their programs are "hacks".

>Given the few real decent titles for the ST/TT, my choices were limited.

Word processing and DTP are still quite possible on the ST/TT line, at
least if a [insert your favourite language here] version of e.g. Tempus
Word pro, papyrus 4 or Signum! is available.

>I'm sure if I were a musician, that would be different.

>The fact that there are 100's of times as many
>apps for my PC as there were for my TT is the major reason I switched.

That's a stupid reason. I'd switch if I really _needed_ an application
that is not available on my current platform, not earlier. And this is not
yet the case.

To some people, there are.

>Mac world?

Well, for good Atari apps, have a closer look on Calamus SL. Other Atari software may not be as good as Mac software, but esp. the German versions tend to be cheaper - _much_ cheaper. There is a demo CD available from ASH, AFAIK, that presents many Atari applications under MagiCMac.

RBerry's TAX-TIME CLEARANCE AUCTION
Classic n' Rare ATARI and VECTREX blowout!
Much as I hate to do it, I've got to get rid of this
stuff to help out with taxes and my new house,
AND A NEW BABY BOY (girl?)
Please bid away!   I'll be sending an e-mail
update daily to all those who request. Please
do not respond to this lame-o PRODIGY address,
but instead to: 7496295@mcimail.com.

Take note of Frogger II 3 Deep and some other cool
hard to finds within!

Shipping is 50 cents per cartridge, and I'll accept
all forms of payment save credit card. (Of course,
I'll wait for checks to clear, first). Minimum bid for
cartridges is $1.00, and all raises must be in $1.00
increments. Updates will be posted daily, as long
as they are sent to:
     7496295@mcimail.com.

Bidding ends on April 10th, 1996, so hurry on up now! Payment will be sent to

Robert A Berry
221 Reamer Street
Auburn, CA 95603

Please, no trades desired.

Here we go!

I think you'll be quite surprised at how good some of our Atari software actually is. Using MagiCMac still doesn't really mean you really are running a software emulation of an Atari. MagiCMac is good, but not that good :-).

There must be decent software for the Atari platform anyway! Why else would we have a .advocacy newsgroup :-)

Ciao, Chris W.

|
||| can work even better with _limited_ access to the bus --- which is
||| available with busmastering devices.
||
|| DMA means the external device controls the bus. There is no
|| 'limited' access. It's an all or none proposition. The external
|| device needs to let go of the bus for anything else to go accross
|| it.
|
|I believe there are some cunning hardware hacks that mean this is not
|necessarily so. However, most of the cache misses will not come during

Experience would indicate otherwise & PC's are relatively
unsophisticated as a matter of cost management.

|DMA transfers, so the problem doesn't occur too often in practise
|(except perhaps in very heavily loaded systems)
|

||||| ... PCI-to-PCI transfers?
||||
|||| Yep , again the CPU doesn't have access to the bus _at the same time_
|||
||| Why would it want to? The CPU doesn't need to use the PCI bus to get
||| to its memory, it has the memory bus for that.
||
|| Presumably the backplane just hangs off the main bus. Also, to get
|| anything off the backplane, memory will have to be accessed at which
|| time the main bus will be tied up regardless. However, considering
|| the economy of PC's, I doubt that the backplane isnt an extension of
|| the main bus.
|
|Yikes! What do you mean by a backplane? A large grounded sheet of
|metal, or the component that connects the L2 cache controller (or
|CPU) to the main memory?
|

If you dont know what a backplane is, then you dont really
have a place in a conversation of this kind.

|| However, cache are not silver bullets. The cache will miss eventually.
|| Considering that a CPU is 1000x faster than a disk, the time a disk
|| holds the bus can be an eternity (relative to the cpu).
|
|It is a broken architecture indeed where a disk writes directly to
|main memory. The world has moved on a long way since then...

Please tell this to my clone.

|
|| Not quite. Once the devices hit the bottleneck, they'll idle. 2
|| disks can request the SCSI bus at the same (for xfer) and mutliple
|| devices can hit the main bus at the same time. When this occurs,
|| something will have to wait. The is true with SCSI, ethernet, a
|| backplane, or even an integrated architecture main bus. Also, loose
|| timing constraints implosed by generality in backplane bus design
|| should also contribute to wait states as synchronization and
|| parallelization becomes more complicated to manage.
|
|Yes, if there is bus contention, something must wait. However, this
|mostly does not happen. The main alternative (dedicated connection
|from every component to every other component) is frighteningly
|complex and expensive...

Thinking such as this rather explains PC's...

>>And I doubt teachers prefer the pupils to just click.

Talk to some teachers some time about how much time they have to learn to install Linux on an unsupported computer platform, or how much money they have to spend on unsupported and expensive upgrades for those platforms.

Teachers prefer their pupils to learn... not to have to spend their time making their own books and paper, or having to cobble together usable computers from obsolete and unsupported orphans.

(And no, "learning" to make paper is not what they have in mind.)

I think that Atari should port MTOS to the PPCP platform. That would keep
the operating system alive while allowing it to run on fast hardware.
They should ask Apple for the source code to their 68K emulator and, if needed,
ask Motorola for some help making a DSP emulator. At first it might be
slightly slower than a Falcon when running 68K code but it would blaze running
ported code. Atari users could still use MTOS and their old programs while
enjoying a fast processor and cheap hardware. It would also allow them to
run NT, MacOS, Solaris and AIX if needed. And if Atari bailed then they
wouldn't be stuck with a dead platform. Opinions?

Actually, IMHO just about anything would be more educational then going after
yet another fad. May be if they would teach kids to use a bloody library, they'd
know what t do with the Net, when they actually need it...

Indeed. Does not really depend on how fast a machine is. Even a 800XL, if you
managed to connect it to , say, ISDN adapter, could pull data faster B^)

Yes, but text-only at 2400 isn't as fun and glamoruos as looking at nekkid
girlies in newsgroups... B^)

If these people don't learn that there are other, even ASCII browsers in
use (lynx), they deserve their pages to be ignored by all non-Netscape
users. BTW: some people seem to discuss the idea of making their home
pages inaccessible to Netscape.

RBerry's TAX-TIME CLEARANCE AUCTION
Classic n' Rare ATARI and VECTREX blowout!
Much as I hate to do it, I've got to get rid of this
stuff to help out with taxes and my new house,
AND A NEW BABY BOY (girl?)
Please bid away! All games are in nice shape
and a part of my collection I need to liquidate.
I'll be sending an e-mail update daily to all
those who request.

Take note of Frogger II 3 Deep and some other cool
hard to finds within like Shuttle Orbiter, XONOX
games, and other treats.

Shipping is 50 cents per cartridge, and I'll accept
all forms of payment save credit card. (Of course,

I'll wait for checks to clear, first). Minimum bid for cartridges is $1.00, and all raises must be in $1.00 increments. Updates will be posted daily, as long as they are sent to:

fzgd51a@prodigy.com

Bidding ends on April 10th, 1996, so hurry on up now! Payment will be sent to

Robert A Berry
221 Reamer Street
Auburn, CA 95603

Please, no trades desired.

Here we go!

The Atari TT030 is equipped with a 32 MHz 68882 FPU.

"Outside", the VMM software for Ataris and compatibles with PMMU, is one
of Uwe Seimet's programs. See c.s.a.st for his address.

It can be "easily upgraded," eh? Please define "easily."

>Like I said... actually TALK to some teachers.

I have. Most like working with the tools they know best (usually Mac).
I've seen teachers use Atari/TOS, Amiga and Macintosh computers far more
effectively than DOS/Windows machines. Although a solution for truly
incredibly easy TOS Internet access isn't out yet, there are two different
packages reportedly in the works. One is being beta-tested. Should the
teacher throw out all those horrible Atari systems and buy new Pentiums,
just because there's going to be a wait?
---
More importantly, what computers should be used to teach industrial design
and drafting in schools? What machines should be used to teach video
applications? Music? Entrepreneurship (many entre. can tell you horror
stories about Windoze)?
-
A computer, or any other machine, only delivers as much utility as is
invested into it. If I was told that my child was "learning about computers"
by installing simple Internet software and browsing the web, I would pull
him out and enroll him in a private school. If I learned that my child
was installing Internet software while learning about domains, FTP
addresses, SLIP, etc., I would call that education. I certainly don't want to
send my kid to a school that considers simple Web browsing to be educational.

>a 'donated' 386 is about in the same position as a falcon.

So did the original article and photograph of a teacher with a room full of unusable Atari computers include Falcons..?

I'm willing to bet it did not.

In THAT situation (the one that began this discussion), I'd far rather have a "lowly" '386 computer as it can be easily upgraded with supported hardware and software to be usable.

Like I said... actually TALK to some teachers.

Computer geek techno-babble is great for newsgroups... teachers need REAL solutions.

BobR,
It is really not hard to set up a communications program on the Atari
ST. In fact, I'd say it is much easier than installing one to run on
Windows 3.1. Furthermore, there are Web browser options and ones that
don't even require Linux. But, really, the point is that Internet
access in schools is for informational purposes. What information
isn't available in good ol' text? I'd say quite a bit of the WWW is
not of much educational value.
Also, the Atari, IMHO, is not obsolete. If you think so, fine. Of
course many schools have 680x0 Macs and those might also be called
obsolete. Are Ataris supported? If not, there'd be no need
for newsgroups for them, would there? How about Toad? ST Informer?
I could name numerous dealers, user groups.
Finally, how many schools can afford Power Macs and 486s? Should
taxpayers pay the money for more expensive machines so that
students can look at GIFs?
As a future teacher, I'd say that giving students the impression
that the only computers in existence are Macs and PCs is wrong.
I dislike the commercialization of schools. We are not in
the business of telling students which name brands to buy.

Hmm you really rate the TT against a 386? I must admit I own a p60 plus

a TT and I still think my TT has the edge in ease of use and calculating.
I know I am wrong, but I do love my TT for being the first major computer
I bought out of my own money. ahh well horses for courses

Nick

>   Ummm... I thought the TT has an fpu.. At least mine has, I think.

Indirectly, you are both correct. But...

The TT's FPU is a separate chip (68882), whereas the 486 has an FPU
embedded into the CPU.

A fairer comparison would be either :
(1) 80486DX2/66 with 68040/66, or
(2) 68030/68882/33Mhz with 80386/80387/33Mhz.

(The TT CPU and FPU are already 33Mhz, but are _underclocked_ to 32Mhz)

Given the more efficient Motorola CPU/FPU (68030/68882) in the Atari, it
will be faster than the equivalent (same speed) Intel 80386/80387 in a
competitor on most real-world tasks.

Poor OS's or app software will drag the performance down. I'll make no
comment as to which OS fits this description.

(contrived "my weewee is bigger than your weewee" examples will obviously
be promoted by the protagonists on either side to prove the other wrong
or inferior)

>We are not in the business of telling students which name brands to buy.

Very true.

However... teachers ARE in the business of teaching.

Having hard to use tools only makes the job of teaching (which is already difficult enough these days) needlessly more difficult.

Having a stapler (whatever brand name it might have on it) which required the teachers or students to make their own staples would be stupid to use in a classroom situation.

Why handicap the teacher with (ok, let's say) virtually unsupported computers.

If the only support available is via newsgroups, how is someone currently unconnected to the net supposed to access them..?

If the only store still selling Atari products is in Severna Park, Maryland, how is the teacher in the picture supposed to know that..?

If the computer stores nearby which are filled with IBM and Macintosh software have never heard of Atari computers, or worse yet, laugh when asked about them, what is the teacher supposed to do..?

It's not that Atari computers are not useful, or that they absolutely cannot be used on the Internet, but they are almost completely impractical in a normal classroom setting.

Well, probably they would not care much, because last I heard Netscape had about 90% of browser market.

OTOH, it seems that saying that Netscape is the next Microsoft has some ground: they start to generate the same irrational hatred...

True enough in your case.

However, the original poster that I was responding to was comparing two _different_generation_ processors. It was sort of like comparing 1970s Punk rockers to 1980s Rappers. Neither is really comparable to the other.

Therefore, I was suggesting that a comparison of same-generation processors would be fairer.

The 486 takes fewer cycles to churn through each instruction than it's predecessors in either camp, be it x86 or 68k through to 68030. (Some might say Intel used "brute force" instead of "elegance". I shall not comment on this). Because of this, it should be compared to a Motorola contemporary: the 68040.

But the poster preferred to compare a double clocked DX2 with a single clocked, older generation 68k. Sort of like comparing a Jaguar XJS to a Ford Sierra RS. Both are powerful, but neither compete with one another.

As I said in my post, bad system or application software can sap a lot of performance from the computer. Irrespective of platform.

The 7200 will be compatible with the new O.S.!!What part do you not understand?
There is a rom sim slot on the mother board in case..

The Nubus based PowerMacs are two years old..Runs current software and O.S.

>"tools" and "compilers".

Did the mention ease or triviality. Otherwise, YOU fail to grasp what what was being talked about. Oddly enough, this is something that PC users didn't care for for years: being the computer masochists.

Regarding UNIX: administration is occasionally a bitch but the various shells are quite usable. Tools schmools. All that is required once the basic system is up is MAKE and CC which consists of typing 'make'. In some cases this can be simpler and easier than many Windows setups. IRCII vs Netscape (win32) pops to mind.

>
>Schools need something that works, that is easily available, and doesn't

Netscape for LINUX fits this description, Netscape for windows does not.

>cost a small fortune from a niche marketplace that isn't supported by
>anyone except other computer geeks.

Such a tragedy: the kiddies might actually learn something. We wouldn't want them to make papa look stupid now would we. Although, I do admit that teaching a kid to be a unix admin is a bit hardcore, the experience is quite relevant and quite useful. The kid, or the teacher, will end up with a depth of understanding of computers and operating systems far in advance of point and click.

> But the poster preferred to compare a double clocked DX2 with a single clocked, older generation 68k. Sort of like comparing a Jaguar XJS to a Ford Sierra RS. Both are powerful, but neither compete with one another.

The original poster, me, didn't prefer to compare the 68030 + FPU (i'm now informed) to a 486DX2. I was replying to a statement that the 'The TT was no-faster or productive...'. The poster was comparing _his_ PC to his TT. All it illustrated was my point was valid of

", just think what you could do with a decent OS on the faster PC hardware."

I wasn't saying the 68030 and 486 were the same, but in this case the comparision was valid. He was saying his TT no-faster than the PC. Looking and comparing the hardware, as I did, this should be obvious. However I felt the PC would be significantly faster given a decent OS. Maybe it is with Win95/WinNT/OS2/Linux etc, (I don't want to start a "Call WinXX a decent OS thread), I just know that the DOS/Win setup I have isn't doing the faster hardware justice.

This is a fundamental flaw with the news media, not just computers.
There are quite a few subjects that they manage to grossly misinform
the public about. Computers just seem to be the mis-information binge
of the moment...

Is there any chance that there might be a new Falcon coming out, the 030
has seen better days, so has the 040, even with a DSP a Falcon is just too
slow, I think it is time for a new machine-a PowerHouse. Unfortuently
computer power is measered in which computer can RayTrace a 640-480 image
faster rather then which computer is more useable, while it is true that a
Atari has a better OS and can do things that PCs can't, when it comes to
CPU intensive tasks such as RayTracing (or 3D anything) Pentium based
systems have the lead and PowerPCs even have a edge over them. The Falcon
can not hold its own in these areas, MagiCMac seems to be a golden
opertunity!!! For artists who need fast 24bit color support or Floating
Point Power imagine running Phoenix on a 150 mhz PowerPC, more work can be
done, you can try more things, you could see what something will look like
NOW instead of waiting hours for rendering.
Got any info.......Email me............................

BobR,
I certainly agree with your assessment on using the best tools in schools. However, I don't agree that this excludes the Atari from being a viable alternative. In my experience, there is usually a computer literate teacher who helps their colleagues with problems. Teachers would not run to the nearest computer shop at the first hint of trouble. Since the ST is easier to use than any clone, I don't see your point about support. You need less support with an ST. If you mean repairs, well, that's a problem but STs, in my experience, are fairly reliable.
Again, though, not all schools can afford the newest Pentium or Power PC. I ask, should taxpayers shell out the money for the most expensive system so their children can view GIFs? If so, why? I also wonder what your thoughts are on the educational value of the World Wide Web. I can tell you that a school near me, here in Maine, has Internet access and hardly anyone uses it. Students that have been using haven't been doing anything educational with it. These are the opinions of teachers.
Again, as far as support goes, I would just like to point out that Toad is not the only dealer. I think you know that but I just want to make sure others reading your posts aren't misled. The teacher in California is lucky; there are tons of dealers in her state.
Finally, knowledge about the ST easily translates over to the clone environment. The file structure is the same, you can find comparable programming languages (I used to bring my BASIC work home to my STe in high school) and GEM is useful to know since Microsoft is just starting to catch up to it.
BTW, Bob, I believe I saw one of your articles in Atari Interface a while ago. Good writing.

>difficult enough these days) needlessly more difficult.
>

That's an interesting turnaround: ST's hard to use.
It's so nice how history gets rewritten.

Short of the first step, complexity in both areas is exactly the same, especially if you stick to the standard system software. Downloads are still downloads and sigs are still sigs, regardless of the front end machine.

>Having a stapler (whatever brand name it might have on it) which required the
>teachers or students to make their own staples would be stupid to use in a
>classroom situation.

Except if the goal of the classroom was to give the students any insight into how the device worked. Unfortunately, the US tends towards this superficial sort of education you are alluding to. With the exception of sysadministration under linux, no part of the process is any more complicated for an ST.

>
>Why handicap the teacher with (ok, let's say) virtually unsupported computers.
>

Because most of the software on the PC software is just shareware to begin with. Excepting hardware service, the PC doesn't offer any real advantage wrt to 'support'.

BTW-by this point in time each school should have available someone of a sysadmin level anyways.

>If the only support available is via newsgroups, how is someone currently
>unconnected to the net supposed to access them..?

Try logging onto a bbs. If you cant manage to find a bbs with a usnet feed, then there are always online services to get you a bootstrap. This is probably where the technically illiterate would likely start

```
    anyways.

    Also, there is always the possiblity of using 'gasp' non-internetted
    bbs as well. The Internet is not the entirety of the online world
    to begin with.

>
>If the only store still selling Atari products is in Severna Park, Maryland,
>how is the teacher in the picture supposed to know that..?

Your statement is completely unjustified. Any comments made about Netscape (at least in this thread) have been based on performance of thier product. This is neither irrational, nor it does not classify as hatred.

What has been at issue is more fundamental philosophies regarding problem solving and software engineering. Netscape & Microsoft both have attitudes in this regard that disgust Atarians (at least this one).

Also, as long as Netscape maintains the specs for html & other standard extensions: getting locked out will not be a problem for them.

Perhaps I should have been more to the point.

A 386, of any kind, is about in the same position as an ST. The 386 for all practical purposes is an orphan. If not for ISA cards it would be completely so. For most things, those ISA slots are a neccesity, vs being a nice extension. Also, any recent PC software, just wont run acceptably on 'slightly' older machines, if at all. Netscape will barf all over that machine. In fact, considering this, there should be a Lynx for DOS. Otherwise, your precious Web is innacessable.

Upgrading it to the point of making it usable will leave nothing but the case and floppy drives left. This doesnt make much sense for 'donated' hardware.

As far as net relevant hardware support goes: the ST always could use other hardware anyways. A SCSI drive is a SCSI drive and modem is a modem. No 1-900 support numbers needed there...

>
>I'm willing to bet it did not.

You'd be better off giving them a better case and power supply. They'd get the same use out of it under your reconing.

>
>Like I said... actually TALK to some teachers.

Ah, yes: outsmarted so you will insult us all now.
A clue: teachers are supposed to be educated. They did waste all that time in college after all. (some states even require grad school) If they can't handling learning something new, teaching it is far beyond their capacities and ideally they should be replaced.

Nevermind that technobbable, or even jargon, ever really entered this discussion.

One 386 will hardly suffice for an entire class.

A _real_ solution?

Install a VT100 terminal emulation software (e.g. CoNnect) on all those
Ataris. Get a Pentium, add 16+ serial ports, install Linux with lynx,
ncftp, irc, tin, etc. - voila! Internet on even an STfm.

Again, I'm not saying the ST is completely useless, just not applicable to the normal classroom environment.

In the situation in question, that of "using the Internet" (which to most people currently translates to "browsing the World Wide Web", undoubtedly including the teacher in the original article which started this thread), the PC is *orders of magnitude* easier to use than an ST.

To install Netscape, you just click on "Install".

To install any of the ST "WWW solutions" you have to be a cross between a computer geek and a rocket scientist. And even when you get them running, the ST itself simply cannot match the performance of a relatively inexpensive PC... the kind school systems can afford. A teacher just can't afford the time necessary to research an obsolete computer system. And if there's no "computer guru" teacher in the building who CAN take the time to "tinker" with an "off the wall" computer, the teacher (like the one in the picture in the original article) is stuck.

As for the educational value of the World Wide Web...

A very close friend of mine has a Jack Russel Terrier.. a somewhat unusual breed of dog. I easily found several pages devoted exclusively to them, with quite a few links to other pages with JRT content. A student writing a report on Jack Russel Terriers would have found a wealth of information.

I also recently had the need to find information and pictures relating to dragonflys. A search at Yahoo turned up more pages relating to "bugs" than I ever wanted to know about, especially as it was on my lunchtime. A student could find almost anything they wanted to know about insects on the WWW. However, my 1040STe, as much as I love it, could NOT handle the document formatting or the 8 bit color pictures the sites had to offer.

There's a world of useful and interesting information, just perfect for a schoolroom environment, beyond the porno and glitz and commercial exploitation.

IF you have the hardware and software that can take advantage of it.

And unfortunately, as the original article stated, the Atari computer can NOT be part of it all.

>I think that Atari should port MTOS to the PPCP platform.

Sure... except that Atari is no longer in the business, and couldn't care less about it.

You call them about their computers, and they tell you to buy a PC...

Having looked around the desktop section on web.cnam.fr, there was an archive for geneva release 002->003. I also heard that it is now at release 004.

Any info on the release files, if they are free or commercial upgrades, where to get them (UK) would be appreciated.

Andy.

Hades040 and Hades060s were shown at ProTOS, the Falcon MKX was shown there as well. Supposedly, C-LAB plans to release TOS 5 and an 040 soon.
Of course, in the mean time, there's nothing preventing you
from getting an 040 accelerator (cheaper than buying any new Falcon to hit the street).

I'm getting real tired of this thread myself and for some reason just had to voice my opinion. A 1040STe is old, a Falcon can handle 16-bit displays so let's not gripe cause we are to cheap to upgrade. Further more you don't just click 'Install' to use NetScape either. Someone has to enter the setup for your internet provider into the darn program. If you don't know what a DNS is or an IP address is then you are no better off with a PC. I'm sorry, but install programs are for idiots.

I partically don't like being told what I can an cannot keep up with on my Atari. If *you* have a problem with *your* Atari I suggest you solve it or move on. I do all my internet access from my home on my Atari, as for as I'm conserned I'm keeping up.

If you want free stuff like A home Page, A case Of Topps NBA cards, A case of Nabisco cookies, A tetra 3 gallon fish bowl kit, A tetra 2 1/2 gallon fish bowl kit, a Gatorade gymbag, a gatorade towl, a gatorade hat, Some power ranger videos, 20 0.5 ounce packs of chiclits or An atari Jaguar and games then go to http://www.kidscom.com
When you are there click on the register button. At the part of the registration where it says to type in the name of the person who sent you there type Chase Ward. At the part where it says to type the email address of the person who sent you there type ac684@sfn.saskatoon.sk.ca
Once you are registered you can begin to collect kidkash points. When you have enough points you can get a free atari jaguar or some other stuff. It is super easy to collect points all you have to do is go there once a week. You can get extra points by playing the online games they have there. EVERYTHING ABOUT THIS IS FREE. This is mostly for people younger than 14 but if you are an adult then you can go to. They have a special place for adults. You still get the free stuff. THERE IS NEVER ANY OBLIGATION. YOU DON'T EVEN HAVE TO GO BACK TO THE PAGE EVER IF YOU DON'T WANT TO.

Why does it have 90%? Because several homepages are (or at least claim to) be
incompatible with other browsers. If 50% of homepages were incompatible
with Newscape, people would get other browsers.

>OTOH, it seems that saying that Netscape is the next Microsoft has some ground:
>they start to generate the same irrational hatred...

Monopolies _must_ be fought, Netscape _is_ building a monopoly. There's
nothing irrational about fighting monopolies.

Thorsten

Right. So combine that with his point? It works worse + most people are not caught up in worshipping Microsoft. The result? Microsoft will crumble.

Actually Mickeysoft are scrambling to improve the quality of their products because they know the above fate is imminent. You can't fool people forever, and unless you have their blind, unquestioning loyalty, you will lose them.

The real enemy of Microsoft is, paradoxically, not the conscious, thinking user, but the one who doesn't give a rat's ass _what_ is on his computer as long as it works---the same user who made Microsoft big in the first place.

This is stupid. If someone offered me brand new $1500 4WD Lamb that gets 100
miles to the gallon, I'd fucking pull out my credit card! Duh! Wouldn't you?

 >say.  PC bashers have to comfort themselves by pretending that just
 >because the PC is not perfect, that it is absolutely no good, and that is

It's more of an OS issue than hardware, if you haven't noticed. Most of the
advocacy newsgroups you are crossposting to are about operating systems that
run on PC's (among other things). NextStep, OS/2, Linux, NT, UNIX...

I am looking to buy a 1040STe computer. Anyone with one for sale, please
leave message. Thanks:-)
P.S.: I will gladly pay postage.

Aha. my error.

I read somewhere about some patents from 1980 which were now "free", and
the number 4000000 occurred in that paragraph or the next one.

So I guess that they sort of became equated ("1980=#4000000").

Thankyou for correcting me.

BTW: Did Atari get any money (licensing fees, for example) from M$ for
the use of Atari copyrighted games? (Or have those copyrights
expired/become nullified/been transferred)?

>original IBM AT keyboard? They are in different leagues, completely.

Yup. I use a genuine IBM keyboard on both of my computers now. There's nothing else that compares to the feel of these keyboards, and the layout is about as good as it gets.

But it took IBM a couple of tries to get it right. Remember the *original* IBM PC keyboards? The ones that have that stupid key between the Z and the shift? The IBM "engineer" who designed that keyboard should have been drawn and quartered. And they unfortunately started a trend that some companies (DEC comes most prominently to mind) followed (and, I think, continue to follow).

This isn't just a question of having to adapt to a slightly different layout. I've been a touch typist since I was in high school, and believe me, the introduction of a key between the Z and the shift really messes things up. But I will admit that the feel of the original keyboard was wonderful.

No, one of the big reasons people originally bought the IBM PC was for the name: they figured that it had to be good quality (because their typewriters are good) and that IBM would stand behind it (i.e, they'd get better service from IBM than they would out of another computer company). Well, they didn't get good quality out of IBM (the PC has always been a piece of junk as computer designs go), and the question of service is debatable.

Moral of the story: you can't judge a product strictly by the reputation of the company behind it...you have to evaluate the *product*, not just the company.

>You know, this reminds me of the time I worked on a database project

I have to agree completely, having had the opportunity to use a
friend's Atari ST a few years ago. They keyboards felt horrible.

No, you're wrong. Computer advocacy discussions are endless, since nobody
wants to accept anything from the other, and is just interested in
spouting their dogmatic pro- and anti- statements.

>Cheers-
>Sean

>PS At least stop crossposting this everywhere, please.  Thanks!

Well this is crossposted only in .advocacy groups. If you don't want to
read on-topic discussion, you should not read the group itself.

Rob

: too, if you used 'screen'.

However, this was in '89, I had just finisehd high school, the most complicated machine I had ever seen was an Apple IIgs and I had been introduced to MS-DOS 4 weeks before starting on UNIX. By the end of the three months, I was writing scripts to update /etc/passwd, sure, but when I did the database stuff, I didn't know anything. Not about unix, not about OSs in general, and definitely not about databases.

Which, in retrospect, makes me wonder why they ever allowed me anywhere near the machine.... :-)

Bernie

P.S.: Today, I have my very own, super-fast unix machine. But I am still
      longing for a Wyse keyboard ;-/

Really. Sure, Win95 isn't going to run well if you don't install it correctly.
I hate Apple's OS, because it is klutzy, and there is no real 'command-line'.
I hate not being able to have access to a shell, ala DOS or UNIX. They
probably do have a flavor of UNIX that runs on Apples, but Linux isn't
one of them. Linux only runs on Intel-based PCs. Sorry to
make you look like a dumbass, but I have a low tolerance for Mac people who
are clueless and think they know all. If you know a lot about computers
and CHOOSE a Mac, good for you. If you chose a Mac because you don't know
any better, I feel sorry for you. People who buy computers without looking
at what the competition has to offer are pretty sorry. Are you sure you
don't have an AOL account and drive a Yugo, too?

> Myths being refuted..
>
> Macs are overpriced? Can you state an example. And what software is
> overpriced..

I worked at a computer store for two years. Which doesn't make me an expert by any means, but when you compare a Mac and a comperably equipped IBM clone, the Mac will usually be much more of a ripoff. Price doesn't say anything, either.. just look at the software choices you get with the respective computers. I haven't sold computers for a year now, so it would be useless to compare prices.

> Apple is having troubles in keeping their user base? Can you explain increased
> unit sales annualy plus half are first time Mac owners..Can you explain this?
> Or are you just stupid?

You want to hear stupid? Ok, here is a conversation I had no less than 30 times when I used to sell computers (we sold Apples and IBM clones; I worked for the on-campus computer store):

Customer: "What should I get, an Apple or an IBM?"

Me: "What are you going to use it for?"

Customer: "Oh, just to write papers on and Internet stuff. Maybe a game or two."

Me: "It depends on how much you want to spend. The IBM is usually a better deal; Apple makes sense if you are into graphic design, or maybe music."

Customer: "But, aren't IBMs just for business stuff like Lotus? Aren't Apples better for education?"

This is EXACTLY the type of brainwashing crap I talked about in my last letter. This is 80's thinking; a lot of people have no clue that IBM compatibles are inarguably the most versatile machines on the market. They play the best games, they have the widest variety of apps, and the cheapest hardware. A decent Apple monitor will still run you $500-$600 bucks, for God's sake!

> Apple has increased their share in their markets.. What are you babling about?
> Do you have a clue?
>
> You look stupid! You opened your mouth with out thought and accuracy..

You remind me of the people in the Amiga advocacy group. See, according to them, the Amiga is going to make its big comeback any day now. They'll attack anyone who dares question the stability of the Amiga market, but can't pull their heads out of their asses long enough to see that they're on a sinking ship. Kind of like that one guy on here who refused to admit the Jaguar was a dying console. Sure, it sucks to see the company who made your computer having problems, but Apple brought it on themselves. The only reason they might be getting more market share (not that I totally believe this, mind you) is because people were initially infatuated with the PowerPC. IBM left Apple high and dry, so software makers aren't exactly rushing to make PowerPC apps, if you know what I mean. How long have you been familiar with the computer industry, Peter? Any idiot can see that unless other companies start making PCs with the PowerPC chip, the platform will be absolutely dead and Apple will be fucked. And out of business.

Rich

Have to agree. Previously in this thread someone compared the OS to a car.
As long as it gets from A to B who cares. Well, think about it, mr/ms

comsumer can send stuff back to a store if its faulty, demand money back if a fault exists on a car under the 'lemon law', but can you get any software company to admit to faults in their product. It not their HW/OS/SW/etc. its the other companies HW/OS/SW/etc. You don't get Ford saying you car won't start because of the petrol/oil/fluffy dice you use. In addition software companies have the cheek to demand money for support for their _crap_ products. If the computer industry, not just MS, want the consumer market they will need to clean up their act.

With the Atari's / Amigas it worked out of the box and was pretty resilant to being messed around ... can't say that about MS O/S's. My dad deleted IBM.SYS from his HD because his PC wasn't an IBM (mr average i think). They may have looked like a VCR, had the power of a VCR, but at least mr/ms average could operate them. I think the public have been suckered once with the _massive_ marketing of Win95, and won't want to burn their fingers again.

Andy.

Could anyone tell me if Doom on the Jaguar is as good as it is on the Play Station? ie. speed, graphics, sound fx.

Fine, if the Mac OS is not your cup of tea, but others do not share your taste. From the above, you sound like that pimple face 15 year old from AOL under the alias of Jaguar1980 and amrat2000 or so.

Linux will be on the Powermac in Q2..Try Apple.com to read the press announcement dumbass. So who is stupid?

I chose a Mac because of the quick learning curve.. If the Mac OS sucks why did MS copied it with Wintel 95...

You are so misinformed...The IBM compatibles are the most unreliable to use..
Not everyone has the time like you to tinker around with..Others have a life
you know.. Why should I have to spend more time to complete a task on a Wintel
than my Mac?

As for Apple monitors, what are talking about? A decent wintel monitor will
set you back $500-$600..

You need to be informed before you continue to look an idiot...

I don't know about 90%, but your response shows a very US. centric
attitude. For example, about a quarter of the world's population is in
China. Such a tiny percentage of them have used computers that you could
say none have within rounding errors. Add in the 50% of the world which is
so underdeveloped that their only concern is whether they'll be able to
find something to eat today--not whether OS/2 or Windows is better.

The original poster is correct in spirit, if not in fact--PCs are only
used by a very small fraction of the world's people.

Right. But an equally small percentage can afford a car. There are countries where the per-capita annual income is in the tens of dollars. I suppose these people are supposed to save every penny they make (not eating or buying clothes) for the next hundred years so they can buy a computer.

We, as Americans, often forget how well off we are. That's not a good thing to forget.

Your opinion is very unreasonable IMO.

>The people who chose a Mac need only one operating system..If you had a clue,
>you would know. Plus Linux will be a option..

"Linux will be an option" contradicts your first statement. I thought Mac owners need only one OS. Isn't that what you just said?

>Apple is having troubles in keeping their user base? Can you explain increased
>unit sales annualy plus half are first time Mac owners..Can you explain this?
>Or are you just stupid?

I don't know where you're at, Peter. Everywhere I see people leaving

the Mac and going PC instead. Every store I've been to carries
a smaller and smaller selection of Apple software. If their user base
is increasing, it must be very miniscule compared to the PC machines.

>Apple has increased their share in their markets. What are you babling about?

What world are you in, Peter!? You call marketshare going from 13%
down to 7.8% an increase!? Reality, Peter. Check it out sometime.

>You look stupid! You opened your mouth with out thought and accuracy..

Pot. Kettle. Black.

'Nuff said.

I port of linux to the mac is in the works. Apple is aiding in the project
and they expect to have a release that will work on the 6100/7100/8100 this
summer. I would still probably use MachTen if I wanted to run UNIX and
had the money (that is the beauty of linux, it's free).

>I worked at a computer store for two years. Which doesn't make me an

You will really have to pick a PC and a Mac with prices and show how the
Mac is a ripoff for your statement to carry and weight. The argument that
the Mac has less software definately has merit. But the real question is:
is the Mac missing any software that I want to use?

>This is EXACTLY the type of brainwashing crap I talked about in my last letter.

Please explain why PCs are the most versitile computers on the market.
And as for Apple monitors being expensive, don't buy them if you
don't think that they're worth it. Buy some crappy SVGA monitor with
.38 dot pitch that runs at 60Hz. From my perspecting, Apple monitors have
a good price/performance ratio. I've only ever bought one (normally I buy
a radius monitor) but it has a nice sharp picture.

>believe this, mind you) is because people were initially infatuated with

>the platform will be absolutely dead and Apple will be fucked. And
>out of business.

Please explain how IBM has left Apple "high and dry"? And there are
over 1700 PPC applications out now and most new mac applications are going
to be PPC native. Currently, IBM, Motorola, FirePower, PowerComputing and Be
make PPC computers (I'm probably missing some).

You are. I list OSes that EXIST for Intel machines; you show me vapor.

> I chose a Mac because of the quick learning curve.. If the Mac OS sucks why did
> MS copied it with Wintel 95...

Did you ever see me hold Win95 up as the greatest OS around? The only reason I use it is because I have to run the Office 95 Pro suite, unfortunately. It crashes all the time, and is generally a piece of shit. But at least when it does crash, it shows you a memory dump. The Apple OS shows a cute little bomb with an ever-so-helpful error message like 'invalid system fork'. If it shows one at all. You work in a library? Try reading a book, maybe you'll pick up some grammar..

> > choices you get with the respective computers. I haven't sold

> Evidence please..You still have not answered my question...

Look, it is stupid to show specific computer prices. What prices apply to one store are not going to hold true somewhere else! Besides, there are IBM compatibles that are more expensive than Apple machines, and there are some much cheaper. That's the neat thing about an IBM machine, you see, is the flexibility in choosing your hardware.

If you use a Mac and it does for you what you need it to, great. WHO is misinformed, anyway? Didn't this discussion start because you thought you need a P-100 to run Win95?! You have no clue about IBM systems, yet you dismiss them as inferior to Macs. I have SOLD Mac systems, and HELPED people set them up and use them. The fact that you refer to these machines as "Wintel" shows just how stupid YOU are. Windows is one of many operating systems available, and Intel is one of several CPU manufacturers for these machines. With Apple, you get no choice.

> As for Apple monitors, what are talking about? A decent wintel monitor will
> set you back $500-$600..

You are wacky on the junk! You can get GREAT Viewsonic and MAG monitors for $300! Passable monitors for $225! For $300, Apple will GLADLY sell you an AppleColor monitor, with the razor-sharp dot pitch of what, .39??!!

> You need to be informed before you continue to look an idiot...

There you go with this "misinformation" crap again. Go hang out on the Amiga advocacy board. You'll fit right in.

> Tsh, tsh..PowerComputing, Pioneer, Motorola, SuperMac, Umax, DayStar digital
> are in the Mac clone business with more to come.

Ok. So, where is this hardware? They're not in any Computer Shopper ads, and I sure as hell don't see them in any local computer chains. You're talking vapor again!

> Next time you respond, back up your big stinking mouth...

My, aren't we just a fount of knowledge...

I'd go weeding through the Shopper and show some prices, but I have better things to do. If this discussion is still going on next week (spring break!) I'll post some specifics. In the meantime, just open the damn magazine and look for yourself.

[Stuff Deleted]

: Beacause it guarantees Gates will never influence the minds of the vast
: majority of people.

: Consumers demand quality - a car that works like the average PC - dropping
: the engine every now and then - will never sell.

Your metaphor is a little drastic. When Windows GPF's it's more like a car quitting on the highway. It can be dangerous as all heck, and is most certainly annoying, but you can probably get it working again, and go on your way. I know people who put up with this in their cars. I don't.

: Just think of how a pathetic interface like DOS managed to dominate the PC
: market. A normal consumer would never buy a paper where the maximaum length
: of a headline (file name) was 8 characters.

If you only knew of paper that with enough room for 8 characters, you'd probably write in 8 character lengths. A lot of people I know do not know that a PC can run other things besides DOS. They think I'm some esoteric PC user because I run Linux at home. Of course, people who make computers their living know of better operating systems.

: Windows - which many have been led to believe is some kind of technology
: leader - is hideously ugly and hard to use. Totally unaccaptable to the
: average person. Windows users today are therefore far from average and
: incredibly forgiving. But we a re talking about a minority - PC users in the
: industrialized world. They won't make a dent in human history.

Windows is a dominant force on the PC. People don't see that their data is in jeopardy, they only see that they can get their work done with minimal effort

on a Windows machine. They become accustomed to the crappy Redmond paradigm
and become reluctant to change.

: The only envronment I've seen that actually works is NeXTSTEP, but NS is
: still far too demanding on the brains of an everage person.

: The point is - you should be able to expect the same quality of a computer
: as you do of a car.

Should, but again, people have become accustomed to shoddy software.

: Microsoft has never been able to and will never provide that quality.

True... too bad people now accept that.

While in So. Cal this weekend, I picked up a second
Jag for $49.00 from the Good Guys. That store had
4 more at that price. They were floor models.
Traveling to the next town (birthday shopping)
another store had 5 systems, all $49.00.
I'm sure it is true for most of the chain.
While at Toys-R-Us, Jag games are going for
$19.00 to 29.00. I purchased Club Drive for 19.00
Syndicate and Iron Soilder for 29.00 ea. There

were several other selections that I already had
purchased available as well.

Any one seen the CD-Roms on sale anywhere?

Mike

hherndon@linex.com (Harold Herndon) said unto the masses:

> I just
>don't see why Amiga users seem to hate these machines soo much. Has any
>of you Amiga users ever used a Windows 95 machine running at 133mhz. I
>liked it a lot.:)

Just think what a decent operating system could do on 133Mhz ;-)

I don;t think they hate it, its just they see what can be done on a 8Mhz 68000 with 1MB (ie 8Mhz 80383 1MB) then look at what Microsoft achieve on 133Mhz Intel 16MB systems and think 'what a waste'.

In my experience windows spends to much time swapping to disk. Whilst this is happening your 133Mhz processor is waiting. Don't give me any _crap_ about multi-tasking, your system (like the amiga/atari/etc) has only ONE bus and therefore entry to memory. Therefore it's either the processor or disk, not both.

Andy.

I guess I am just stupid, but I was trying to help the librarian
with his grammar. If he can't be knowledgable in his posts he
could at least show some knowledge by using correct grammar.
What I would really like to see is that all Mac advocates take
their preachings to another newsgroup where it belongs.

I need one OS..The ones who have purchased Macs knew that only one OS is
available.  But, I have read posts from Amiga users that they would buy
PowerMacs if linux is available..

```

63% of the k-12 institutions up 4% from last year.
29% of the U.S. higher ed.
76.2% of the color-prepress
47% of the U.S. commercial publishing customers
33% of existing multimedia personal computers are Macs..

Am I wrong, yes your OS may "handle it" but the bus can only service one source-destination at a time. It may switch fast between different requests, but a the end of the day only one is being serviced at a time. I am aware of multithreading, but I've always understood this to be multitasking but from within a single task.

This doesn't alter the fact the when using Win3.1 on my PC it spends an indecent amount of time swapping, something I don't experience on decent systems. Maybe this will change when we upgrade to WinNT.

I agree with your implicit statement of linux being a decent OS, and conversely Window 3 being C***

A particular bus can only transfer information between one source and one or more destinations (*) at one time, yes. Most people consider the type of bus that you specify when purchasing expansion cards to be the only bus there is, but computer systems actually have lots of busses.

For example:

- between the hard drive(s) and the HD controller (eg, a SCSI bus)
- between the motherboard and various cards (eg, ISA, EISA, PCI)
- between the main RAM and L2 cache RAM (if you have a L2 cache)
- between main RAM and/or L2 cache RAM and the CPU
- internally, modern CPU's may have many functional units and their own internal cache, and these also have busses internal to the CPU itself

It's quite possible for a bus-mastering card to perform DMA to main RAM while the CPU continues to execute instructions from its' caches, for example.

Another example is good video cards. They use VRAM, which is a special type of RAM that is dual-ported, so that the video card's circuitry can read video memory and continue to display even while the system is drawing to video memory; again, there is a bus between the VRAM and the DAC/video driver circuitry that's running most of the time while the rest of the system does other things.

A SCSI bus supports (or can support) disconnect/reconnect and tagged command queuing, so that you can send many requests to various devices, and the devices will work on fulfilling the requests at the same time. The SCSI bus will still only transfer data from one device at time during a particular instant, of course.

Good hardware design and good OS design allow the system to perform lots of different activities at once, as per a Unix-like OS using a bus-mastering SCSI card. Poor designs, such as MS-DOS using an IDE drive system, can generally only do one thing at a time and they often require the CPU to be involved as well (as in PIO, I believe).

You get what you pay for....
-Chuck

(*): Depending on the bus design, generally everything on the bus actually sees the data passing through, but they only "pay attention" if the data is addressed to it.

Nah, I prefer not to get lost. I am well aware of what advocacy
is. I also know that its not comp.sys.mac.advocacy. It is
Atari advocacy.

You're wrong. A descent OS can handle swapping and CPU work at the same
time. This is what _multithreading_IO_ is. Do NOT cofuse this with
the Microsoft interpretation of multithreading (wich is just a
stripped-down version of multitasking).

Linux handles it, Unix, OS/2and I think even AmigaOS (but i'm not 100%)
does it. Heck, even WinNT can do multithreading IO! Win31, Win95, DOS
MiNT, TOS etc, does NOT.

Because that was not my intention. The entire reason I posted wasn't to defend any particular computing platform, or (as you evidently misconstrued it above) to preach of some alleged superiority of the MS-DOS machines. My point (for the twentieth time now) was that the entire world is not stupid for using Intel/Microsoft computers because they do the job, they are cheap, they are everywhere, and they follow standards. That's all....when did I ever bring in the issue of whether or not other platforms perform the same? That is irrelevant, the point (again) is that "the entire world" is not a bunch of morons.

>that.. Considering Sun and SGI prosper in their huge niches despite their
>miniscule volume..

What are you talking about!? Sun and SGI do not compete in the home PC market! How many people do you know have Sun or SGI Unix workstations at home?

BTW, my sister just got a Pentium-75 notebook with Windows95 and it flies. You talk about the minimum requirement for Win95 to be a Pentium-100!? You're an idiot, Peter! You know absolutely NOTHING about PC computers! GET OVER IT!

Actually, you know nothing about Atari computers either, for that matter. And I thought this group was about Atari computer advocacy. The fact that we continually argue about PC/Mac on this group shows that you have no knowledge to discuss Atari computers.

/Kevin

Well, the only problem I see here is... What is there to advocate about Atari? I have been a TT030 user (for only about 4 weeks now) and am not seeing/finding anything about it that stands out from the rest of the market that I am familiar with, mainly Amiga, WinNTs, UNIX, Mac. As mentioned, I am relatively new, but I normally can find special little things about a computer within the first few minutes of using it.

If you don't have sufficient memory, then Windows will swap memory to disk (like many other systems do). I have a 16 meg system and don't get ever get swaps unless I start using photoshop with alot of images.

> Don't give me any
>_crap_ about multi-tasking, your system (like the amiga/atari/etc) has

Ever hear the of the term "cache"? My disk controller has one, Windows
has one and the motherboard has one.

These are pretty simple concepts we're talking about, used by both systems.
I wish people would crack open a book before they post!

I would rather say lazy.

But the interesting thing is, while everyone seem to think Gates has concered the world, the reality is that 90% of the World will never use a PC or Windows or any other soft- or hardware as we know it, beacause it's simply too expensive, time consuming and difficult for an ordinary person.

We who use computers today are all nerds or have been forced to it by our bosses.

The vast majority of humanity will never use a PC. In a way, that's comforting.

Hey don't knock the thread.
Probably the first thread of its kind that I've seen posted exclusively
to *.advocacy groups. At least the cross-posting is appropriate. Lets
thank our lucky stars.

I'd agree with that. But I'd also add that there are a lot of people
out there who wouldn't give a monkey's f*rt about Billzebub.

: > : 2600 had to die; who'd want to buy a new one now?

: I have. I said "new." "New" means that there would be sufficient demand
: to justify mass-production, distribution, and retailing - like what you
: see at Toys R Us.

"NEW" to me, means an unused system. I'm sure it also means the same to most people in the world.

People want 32 and 64-bit systems, if not 16-bit. I
: think that was my point.

Ironically, the 16-bitters (which are supposedly dying) are still outselling the 32bit and 64-bit machines. The Sega Genesis sold more last year than the Saturn, PSX, 3DO, Jaguar and 32X combined.

: used 2600 wares is tiny comparted to the NEW vidgame industry. That was
: my point, since it was evidently missed.

It wouldn't have been "missed" if you were a little clearer. "New" means a different thing than "Mass Market."

: Yes, yes of course I know. I think you missed my point again.

Let me guess ... I must do more mind-reading to understand what you're getting at?

My point
: was that you blame the third parties for the "crap games" (low-quality)
: that helped to kill the 2600.

Yes.

Nintendo has argued the whole time that
: the REASON for the "lockout" was so that Nintendo itself could regulate
: the quality of games for Nintendo systems, and thus eliminate this
: problem that you have identified. Comprende?

Problem:

Nintendo didn't really do much to "eliminate" low quality games. If you look at the NES, you'll notice that the NES library has hundreds of duds. The Nintendo "Seal Of Quality" actually meant that a game with that seal of quality would run on all NES's. Nintendo really cared little about quality (and it showed), but rather was interested in forcing anyone who wanted to develop NES games to pay Nintendo large sums of money. If a game didn't "play well", it wasn't "stopped at the gate." Nintendo did do some things like test for bugs and make sure the games didn't obtain offensive content, but they did not care about playability.

It's interesting to note that, following the 2600 crash, all video game systems have employed lockouts in some form or other. The Atari 7800 was actually the first machine to utlize the lockout. When turned on, the machine was (by default) a 2600. The 7800 would search for an encryption code. If it found one in the game, the 7800 would "become a 7800", with better graphics, more memory etc. Word has it that Atari was so pissed off about the Custer's Revenge scandal that they didn't want a game like that showing up on the 7800, which had state of the art graphics in 1984.
